

P54/WGI-14 - Changes to the underlying scientific-technical assessment to ensure consistency with the approved SPM

These trickle backs will be implemented in the Chapter during copy-editing

SPM Page:Line	Chapter/Su pp. Material	Chapter Page:Line	Summary of edit to be made
A3.5 & footnote 12, "compound extreme events"	Annex VII: Glossary	16:17-18	Please add: "The terms 'compound events', 'compound extremes' and 'compound extreme events' are used interchangeably in the literature and this report and refer to.... "
17:Footnote 22	Annex VII: Glossary	32:50	To be consistent with the wording in CCBox 1.3 and the LLHI outcome definition in SPM Footnote, the words in the parenthesis need to be deleted behind the Glossary term "Impacts", which should then only be " Impacts : The consequences of realised risks on natural and human systems, " Note that this doesn't change the definition as agreed with WGII.
17:Footnote 22	Annex VII: Glossary	37:14	The wording in the term and definition of Low-likelihood, high impact events needs to be change to read "Low-likelihood, high impact outcomes: Outcomes/events whose probability..."
18:2	Annex VII: Glossary	62:13	<p>Add the following definition for 'Urbanization' to the glossary: In the WGI report, urbanization is used to mean the process of soil sealing with the change of natural land cover to built environment and urban areas, together with its associated <i>albedo</i> changes, and increased surface <i>runoff</i> and elevated warming. See also <i>Urban heat island (UHI)</i> .</p> <p>Revise the glossary definition for 'Urban heat island' to the following: The relative warmth of a city compared with surrounding rural areas, associated with heat trapping due to the close proximity of tall buildings, the heat-absorbing properties of urban building materials, reduced ventilation, and heat generated directly from human activities. See also <i>Urbanization</i> .</p>

AR6 WGI Report – List of corrigenda to be implemented

The corrigenda listed below will be implemented in the Annex during copy-editing.

ANNEX VII (GLOSSARY)

Document (Chapter, Annex, Supp. Mat...)	Section	Page :Line (based on the final pdf FGD version)	Detailed info on correction to make	TSU
Annex VII – Glossary		1 : 35	Replace “that the term” by “that the italicized term”	
Annex VII – Glossary	Adjustments (in relation to effective radiative forcing)		Added definition (was omitted) The response to an agent perturbing the <i>climate system</i> that is driven directly by the agent, independently of any change in <i>global surface temperature</i> . For example, <i>carbon dioxide</i> and <i>aerosols</i> , by altering internal heating and cooling rates within the <i>atmosphere</i> , can each cause changes to cloud cover and other variables thereby producing an <i>effective radiative forcing</i> even in the absence of any surface warming or cooling. Adjustments are usually rapid in the sense that they begin to occur right away, before <i>climate feedbacks</i> which are driven by global surface warming (although some adjustments may still take significant time to proceed to completion, for example those involving vegetation or <i>ice sheets</i>).	
Annex VII (Glossary)	Agricultural or ecological drought definition	19:7	Replace “Agricultural or ecological drought” with “Agricultural and ecological drought”. Note “and”, not “or”	
Glossary		37:7	Replace “fluorinated gases” with “halogenated compounds”	
Annex VII – Glossary	Apparent hydrological sensitivity		Replace “global mean temperature change” by “global mean surface air temperature (GSAT) change”	
Annex VII – Glossary	Arctic oscillation (AO)		Added definition (was omitted): See <i>Northern Annular Mode (NAM)</i> (under <i>Annular modes</i>).	
Annex VII – Glossary	Baseline/reference		Updated definition: See <i>Reference scenario</i> (under <i>Scenario</i>) and <i>Reference period</i> .	
Annex VII – Glossary	Carbon cycle		Replace “1GtC corresponds to 3.667 GtCO ₂ ” by “1GtC corresponds to 3.664 GtCO ₂ ”	
Annex VII – Glossary	Chlorofluorocarbons (CFCs)		Replace “they break down ozone (O ₃). It is one...” by “they lead to ozone (O ₃) depletion. They are some...”	

			Remove “which are GHGs covered under the Kyoto Protocol”	
Annex VII – Glossary	Climate feedback parameter		Replace “to a global surface temperature change” by “to a change”	
Annex VII – Glossary	Climate scenario		Remove definition (added in error)	
Annex VII – Glossary	Cloud feedback		Replace “global mean surface temperature” by “global surface temperature” Remove “At present, cloud feedbacks remain the largest source of <i>uncertainty</i> in <i>climate sensitivity</i> estimates.”	
Annex VII – Glossary	Cloud radiative effect		Remove “In previous IPCC reports this was called cloud <i>radiative forcing</i> , but that terminology is inconsistent with other uses of the forcing term and is not maintained in this report.”	
Annex VII – Glossary	Cold days/cold nights		Remove definition (added in error)	
Annex VII – Glossary	Cosmogenic radioisotopes		Remove definition (added in error)	
Annex VII – Glossary	Diatoms		Updated definition Microscopic (2-200µm) unicellular photosynthetic algae that live in surface waters of lakes, rivers and <i>oceans</i> and form shells of opal. In the global ocean, marine diatom species distribution is primarily driven by nutrient availability. On regional scales, their species distribution in ocean sediment cores can be related to past <i>sea surface temperatures</i> (Abrantes et al., 2013).	
Annex VII – Glossary	Direct emissions		Remove definition (added in error)	
Annex VII – Glossary	Earth’s energy budget		Added definitions (they were omitted) Earth’s energy budget encompasses the major energy flows of relevance for the <i>climate system</i> : the top-of-atmosphere energy budget; the surface energy budget; changes in the global energy inventory and internal flows of energy within the climate system that characterise the climate state. <i>Top-of-atmosphere energy budget</i> comprises the energy fluxes associated with incoming <i>solar radiation</i> , reflected solar radiation and emitted thermal radiation. Typical units: W m ⁻² . <i>Surface energy budget</i> comprises the exchanges of heat at the surface of the Earth associated with both radiative and non-radiative processes. Typical units: W m ⁻² . <i>Global energy inventory</i> quantifies the excess energy absorbed or lost by the Earth system (<i>ocean</i> , <i>land atmosphere</i> and <i>cryosphere</i>),	

			<p>mostly in the form of heat, associated with <i>radiative forcing</i> of the <i>climate</i>. Typical units: Joules.</p> <p><i>Global energy budget</i> For a given time period, the global energy budget expresses the balance between change in the global energy inventory, the time-integrated <i>effective radiative forcing</i> and time-integrated <i>radiative response of the climate system</i>. Typical units: Joules.</p> <p>See also <i>Earth's energy imbalance</i>.</p>	
Annex VII – Glossary	Earth's energy imbalance		<p>Added definition (was omitted)</p> <p>The persistent and positive (downward) net top of atmosphere energy flux associated with greenhouse gas <i>forcing</i> of the <i>climate system</i>. See also <i>Earth's energy budget</i> and <i>Radiative response (of the climate system)</i>.</p>	
Annex VII – Glossary	Emulators		Replace “one or few line climate models” by “simple climate models”	
Annex VII – Glossary	Energy balance model (EBM)		<p>Make the term a subterm of Emulators.</p> <p>Replace “An energy balance model is a simplified model that analyses the energy budget of the Earth to compute changes in the <i>climate</i>.” by “An energy balance model is a simplified climate model that is typically used as an emulator of climate to analyse the energy budget of the Earth to compute changes in the <i>climate</i>.”</p>	
Annex VII – Glossary	Extreme/heavy precipitation event		Replace “space” by “place”	
Annex VII – Glossary	Glacial or glaciation		Replace “was near its most recent lowest stand” by “was nearly at its lowest level”	
Annex VII – Glossary	East Asian monsoon (EAsiaM)		<p>Replace “Lately in July” by “In July”</p> <p>Replace “north, northeast” by “north and northeast”</p>	
Annex VII – Glossary	Gravity Recovery And Climate Experiment (GRACE)		Replace “A pair of satellites to measure...” by “A pair of satellites that measured...”	
Annex VII – Glossary	Greenhouse effect		Replace “Surface temperature and troposphere...” by “Earth's surface temperature and troposphere...”	
Annex VII – Glossary	Hindcast or retrospective forecast		Remove definition (added in error)	
Annex VII – Glossary	Hydrofluorocarbons (HFCs)		<p>Updated definition</p> <p>A type of <i>greenhouse gas (GHG)</i>, HFCs are organic compounds that contain fluorine, carbon and hydrogen atoms and they are produced commercially as a substitute for <i>chlorofluorocarbons (CFCs)</i>. They are mainly used in refrigeration and semiconductor manufacturing.</p>	

Annex VII – Glossary	Hydrological sensitivity (η)		Updated definition The linear change in global mean precipitation per degree Celsius of <i>global mean surface air temperature (GSAT)</i> change once precipitation changes related to fast atmospheric and land surface adjustments to <i>radiative forcings</i> have occurred. Units are % per °C although it can also be calculated as W m ⁻² per °C. See also <i>Apparent hydrological sensitivity (η_a)</i> .	
Annex VII – Glossary	Interstadial or interstade		Added definition (was omitted) A brief period of regional climatic warming during a <i>glacial</i> or <i>interglacial</i> interval, often characterized by transient glacial retreats. Interstadials are generally of short duration (hundreds to a few thousand years) compared to glacial or interglacial intervals (lasting many thousands to tens of thousands of years). One example of a regional interstadial event is based on millennial scale warming recorded by oxygen <i>isotope</i> ratios in Greenland <i>ice cores</i> , the so called “Greenland Interstadials” (Johnsen et al., 1992). See also <i>Stadial</i> or <i>stade</i> .	
Annex VII – Glossary	Light-absorbing particles		Replace “smelting” by “melting”	
Annex VII – Glossary	Long-lived climate forcers (LLCF’s)		Replace “Long-lived climate forcers (LLCFs)” by “Long-lived greenhouse gases (LLGHGs)”	
Annex VII – Glossary	Low-likelihood, high impact outcomes		Renamed term “Low-likelihood, high impact outcomes” from “Low-likelihood, high impact events” for cross-report consistency	
Annex VII – Glossary	Methane (CH ₄)		Removed “One of the seven greenhouse gases (GHGs) to be mitigated under the Kyoto Protocol.” Replace “Methane is the major...” by “The greenhouse gas (GHG) methane is the major...” Replace “there is risk of increased methane emissions from thawing permafrost, coastal wetlands...” by “there is potential for increased methane emissions from thawing permafrost, wetlands...”	
Annex VII – Glossary	Model drift		Remove definition (added in error)	
Annex VII – Glossary	Montreal Protocol		Updated definition The Montreal Protocol on Substances that Deplete the Ozone Layer was adopted in Montreal in 1987, and subsequently adjusted and amended (including London (1990), Copenhagen (1992), Vienna (1995), Montreal (1997), Beijing (1999) and Kigali (2016)). It controls the consumption and production of chlorine- and bromine-containing chemicals that destroy <i>stratospheric ozone (O₃)</i> , such as <i>chlorofluorocarbons (CFCs)</i> , methyl chloroform, carbon tetrachloride and many	

			others. Since the Kigali Amendment in 2016, <i>hydrofluorocarbons (HFCs)</i> , which were used as alternatives to ozone-depleting substances, have been targeted for a phase-down due to their climate effect as greenhouse gases.	
Annex VII – Glossary	Natural systems		Updated definition <i>The dynamic physical, physicochemical and biological components of the Earth system that would operate independently of human activities.</i>	
Annex VII – Glossary	Nitrous oxide (N ₂ O)		Remove “One of the seven <i>greenhouse gases (GHGs)</i> to be mitigated under the Kyoto Protocol.” Replace “The main <i>anthropogenic</i> source of N ₂ O is” by “The main <i>anthropogenic</i> source of N ₂ O, a greenhouse gas (GHG), is”	
Annex VII – Glossary	Non-linearity		Replace “may lead to abrupt climate change” by “may lead to abrupt climate change and tipping points”	
Annex VII – Glossary	Sub-terms of Pathways		Added definitions (were omitted) <i>Emission pathways</i> Modelled trajectories of global <i>anthropogenic emissions</i> over the 21st century. <i>Mitigation pathways</i> A temporal evolution of a set of <i>mitigation scenario</i> features, such as <i>greenhouse gas (GHG)</i> emissions and socio-economic development. <i>Non-overshoot pathways</i> Pathways that stay below a specified concentration, <i>forcing</i> , or global warming level during a specified period of time (e.g., until 2100). <i>Overshoot pathways</i> Pathways that first exceed a specified concentration, <i>forcing</i> , or global warming level and then return to or below that level again before the end of a specified period of time (e.g., before 2100). Sometimes the magnitude and <i>likelihood</i> of the overshoot is also characterized. The overshoot duration can vary from one pathway to the next, but in most overshoot pathways in the literature and referred to as overshoot pathways in the AR6, the overshoot occurs over a period of at least one decade and up to several decades.	
Annex VII – Glossary	pH		Updated definition A dimensionless measure of the acidity of a dilute solution (e.g., seawater) based on the activity, or effective concentration, of hydrogen ions (H ⁺) in the solution. pH is measured on a logarithmic scale where $pH = -\log_{10}(H^+)$. Thus, a pH decrease of 1 unit corresponds to a 10-fold increase in the acidity, or the activity of H ⁺ .	

Annex VII – Glossary	Plankton		Updated definition Free-floating organisms living in the upper layers of aquatic systems. Their distribution and migration are primarily determined by water currents. A distinction is made between phytoplankton, which depend on <i>photosynthesis</i> for their energy supply, and zooplankton, which feed on phytoplankton, other zooplankton, and bacterioplankton.	
Annex VII – Glossary	Pleistocene		Replace “at 11.65 ka” by “at approximately 11.7 ka”	
Annex VII – Glossary	Pool, carbon and nitrogen		Added definition (was omitted) A <i>reservoir</i> in the Earth system where elements, such as carbon and nitrogen, reside in various chemical forms for a period of time. See also <i>Reservoir, Sequestration, Sequestration potential, Sink, Source</i> and <i>Uptake</i> .	
Annex VII – Glossary	Radiative effect		Removed definition	
Annex VII – Glossary	Rapid adjustment		Removed definition	
Annex VII – Glossary	Radiative response (of the climate system)		Added definition (was omitted) The net top-of-atmosphere radiative flux that opposes a change in <i>radiative forcing</i> as a result of <i>climate feedbacks</i> . Typical units: $W m^{-2}$. See also <i>Earth’s energy budget, Climate feedback and Climate feedback parameter</i> .	
Annex VII – Glossary	Reference period		Updated definition A time period of interest, or a period over which some relevant statistics are calculated. A reference period can be used a <i>baseline period</i> or as a comparison to a <i>baseline period</i> .	
Annex VII – Glossary	Baseline period (subterm of Reference period)		Updated definition A time period against which differences are calculated (e.g., expressed as <i>anomalies</i> relative to a baseline).	
Annex VII – Glossary	Regional climate scenario		Removed definition	
Annex VII – Glossary	Sea level equivalent (SLE)		Removed “However, more accurate estimates of SLE must account for additional processes affecting mean sea level rise, such as shoreline migration, changes in ocean area, and for vertical land movements.”	
Annex VII – Glossary	Semi-empirical model		Replace “global mean surface temperature change” by “ <i>global surface temperature change</i> ”	
Annex VII – Glossary	Stadial or stade		Updated definition: A brief period of regional climatic cooling during a <i>glacial</i> or <i>interglacial</i> interval, often characterized by transient glacial advances. Stadials are generally of short duration	

			(hundreds to a few thousand years) compared to glacial or interglacial intervals (lasting many thousands to tens of thousands of years). One example of a regional stadial event is based on millennial scale cooling recorded by oxygen <i>isotope</i> ratios in Greenland <i>ice cores</i> , the so called “Greenland Stadials” (Johnsen et al., 1992). See also <i>Interstadial or interstade</i> .	
Annex VII – Glossary	Sulphur hexafluoride (SF ₆)		Updated definition SF ₆ , a greenhouse gas (GHG), is mainly used in heavy industry to insulate high-voltage equipment and to assist in the manufacturing of cable-cooling systems and semiconductors.	
Annex VII – Glossary	Teleconnection paterh		Updated definition Spatial structure of climate <i>anomalies</i> that are linked to each other through <i>teleconnection</i> processes or that are the <i>large-scale</i> fingerprint of <i>modes of climate variability</i> . Teleconnection patterns can be visualized using correlation and/or regression maps of <i>climate variables</i> with some <i>climate indices</i> (i.e., those derived from the temporal variation of the main modes of climate variability). They can also be obtained from principal component analysis, singular value decomposition/maximum covariance analysis, clustering based on spatial recurrence criteria, etc. See also Section Atlas.3.1 of the AR6 WGI report and <i>Teleconnection</i> .	
Annex VII – Glossary	Total solar irradiance (TSI)		Remove “It has recently been estimated to 1360.8 ± 0.5 W m ⁻² for the solar minimum of 2008.”	
Annex VII – Glossary	Interpolation uncertainty (subterm of Uncertainty)		Added definition (was omitted) Uncertainty arising from a statistical or physical model-based interpolation of a field between available estimates to create a more spatio-temporally complete estimate.	
Annex VII – Glossary	Trend estiamtes uncertainty (subterm of Uncertainty)		Added definition (was omitted) Uncertainty arising from data fitting to a time-series with potential non-linear and autorogressive character.	
Annex VII – Glossary	Warm days/warm night		Removed definition	
Annex VII – Glossary	Warm spell		Removed definition	
Annex VII – Glossary	Younger Dryas		Replace “A period 12.85 to 11.65 ka...” by “The period from approximately 12.9 to 11.7 ka...”	

Annex VII - Glossary**Coordinating Editors:**

J. B. Robin Matthews (France/United Kingdom), Jan S. Fuglestedt (Norway), Valérie Masson-Delmotte (France), Vincent Möller (Germany), Carlos Méndez (Venezuela), Renée van Diemen (The Netherlands/United Kingdom), Andy Reisinger (New Zealand), Sergey Semenov (Russian Federation)

Editorial Team:

Rondrotiana Barimalala (South Africa/Madagascar), Roxana Bojariu (Romania), Annalisa Cherchi (Italy), Peter M. Cox (United Kingdom), Sergio Henrique Faria (Spain/Brazil), Piers Forster (United Kingdom), Christopher Jones (United Kingdom), Nana Ama Browne Klutse (Ghana), Charles Koven (United States of America), Svitlana Krakovska (Ukraine), Sawsan K. Mustafa (Sudan), Friederike Otto (United Kingdom/Germany), Matthew D. Palmer (United Kingdom), Tamzin Palmer (United Kingdom), Wilfried Pokam Mba (Cameroon), Roshanka Ranasinghe (The Netherlands/Sri Lanka, Australia), Pedro Scheel Monteiro (South Africa), Joeri Rogelj (United Kingdom/ Belgium), Sharon L. Smith (Canada), Ying Sun (China), Andrew Turner (United Kingdom), Bart van den Hurk (The Netherlands), Émilie Vanvyve (United Kingdom/Belgium), Martin Wild (Switzerland), Cunde Xiao (China), Prodromos Zanis (Greece)

This glossary defines some specific terms as the Lead Authors intend them to be interpreted in the context of this report. Italicized words in definitions indicate that the italicized term is defined in the Glossary. Subterms appear in italics beneath main terms.

Date: August 2021

This document is subject to copy-editing, corrigenda and trickle backs.

This Annex should be cited as:

IPCC, 2021: Annex VII: Glossary [Matthews, J. B. R., J. S. Fuglestedt, V. Masson-Delmotte, V. Möller, C. Méndez, R. van Diemen, A. Reisinger, S. Semenov (ed.)]. In: *Climate Change 2021: The Physical Science Basis. Contribution of Working Group I to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change* [Masson-Delmotte, V., P. Zhai, A. Pirani, S. L. Connors, C. Péan, S. Berger, N. Caud, Y. Chen, L. Goldfarb, M. I. Gomis, M. Huang, K. Leitzell, E. Lonnoy, J.B.R. Matthews, T. K. Maycock, T. Waterfield, O. Yelekçi, R. Yu and B. Zhou (eds.)]. Cambridge University Press. In Press.

- 1 **1.5°C pathway** See *Pathways*.
- 2
- 3 **Ablation (of glaciers, ice sheets, or snow cover)** See *Mass balance / budget (of glaciers or ice sheets)*.
- 4
- 5 **Abrupt change** A change in the system that is substantially faster than the typical rate of the changes in its
- 6 history.
- 7
- 8 **Abrupt climate change** A large-scale *abrupt change* in the *climate system* that takes place over a few
- 9 decades or less, persists (or is anticipated to persist) for at least a few decades and causes substantial *impacts*
- 10 in *human and/or natural systems*. See also *Tipping point* and *Abrupt change*.
- 11
- 12 **Accumulation (of glaciers, ice sheets, or snow cover)** See *Mass balance / budget (of glaciers or ice*
- 13 *sheets)*.
- 14
- 15 **Active layer** Layer of ground above *permafrost* subject to annual thawing and freezing.
- 16
- 17 **Adaptation** In *human systems*, the process of adjustment to actual or expected *climate* and its effects, in
- 18 order to moderate harm or exploit beneficial opportunities. In natural systems, the process of adjustment to
- 19 actual climate and its effects; human intervention may facilitate adjustment to expected climate and its
- 20 effects. See also *Adaptation options*, *Adaptive capacity* and *Maladaptive actions (Maladaptation)*.
- 21
- 22 **Adaptation options** The array of strategies and measures that are available and appropriate for addressing
- 23 *adaptation*. They include a wide range of actions that can be categorised as structural, *institutional*,
- 24 ecological or behavioural.
- 25
- 26 **Adaptive capacity** The ability of systems, *institutions*, humans and other organisms to adjust to potential
- 27 damage, to take advantage of opportunities, or to respond to consequences (IPCC, 2014; MA, 2005).
- 28
- 29 **Added value** Improvement of the representation of some climatic aspects by one methodology compared
- 30 to another methodology. For instance, downscaling a coarse resolution *global climate model (GCM)* may
- 31 improve the representation of regional climate in complex terrain.
- 32
- 33 **Adjustment time** See *Response time or adjustment time*.
- 34
- 35 **Advection** Transport of water or air along with its properties (e.g., temperature, chemical tracers) by winds
- 36 or currents. Regarding the general distinction between advection and *convection*, the former describes
- 37 transport by large-scale motions of the *atmosphere* or ocean, while convection describes the predominantly
- 38 vertical, locally induced motions.
- 39
- 40 **Aerosol** A suspension of airborne solid or liquid particles, with typical diameters between a few
- 41 nanometres and a few micrometres and atmospheric lifetimes of up to several days in the *troposphere* and up
- 42 to years in the *stratosphere*. The term aerosol, which includes both the particles and the suspending gas, is
- 43 often used in this report in its plural form to mean ‘aerosol particles’. Aerosols may be of either natural or
- 44 *anthropogenic* origin in the troposphere; stratospheric aerosol mostly stems from volcanic eruptions.
- 45 Aerosols can cause an *effective radiative forcing* directly through scattering and absorbing radiation
- 46 (*aerosol-radiation interactions*), and indirectly by acting as *cloud condensation nuclei* or ice nucleating
- 47 particles which affect the properties of clouds (*aerosol-cloud interactions*), and upon deposition on snow- or
- 48 ice-covered surfaces. Atmospheric aerosols may be emitted as primary particulate matter (PM), and form
- 49 within the atmosphere from gaseous *precursors* (secondary production). Main classes of aerosol chemical
- 50 composition are sea salt, organic carbon, *black carbon (BC)*, mineral species (mainly desert dust), sulphate,
- 51 nitrate, and ammonium. See also *Short-lived climate forcers (SLCFs)*.
- 52
- 53 **Aerosol effective radiative forcing (ERF_{ari+aci})** See *Aerosol-radiation interaction*.
- 54
- 55 **Aerosol optical depth (AOD)** Wavelength-dependent aerosol optical depth is a measure of the *aerosol*

1 contribution to extinction of top-of-the-atmosphere solar intensity measured at the ground. AOD is unitless.

2
3 *Fine-mode aerosol optical depth* Aerosol optical depth due to aerosol particles smaller than 1 µm in radius.

4
5 **Aerosol-cloud interaction** A process by which a perturbation to *aerosol* affects the microphysical
6 properties and evolution of clouds through the aerosol role as *cloud condensation nuclei* or ice nuclei,
7 particularly in ways that affect radiation or precipitation; such processes can also include the effect of clouds
8 and precipitation on aerosol. The aerosol perturbation can be *anthropogenic* or come from some natural
9 *source*. The *radiative forcing* from such interactions has traditionally been attributed to numerous indirect
10 aerosol effects, but in this report, only two levels of radiative forcing (or effect) are distinguished: See also
11 *Aerosol-radiation interaction*.

12
13 *Effective radiative forcing (or effect) due to aerosol-cloud interactions (ERF_{aci})* The final radiative
14 forcing (or effect) from the *aerosol* perturbation including the adjustments to the initial change in droplet or
15 crystal formation rate. These adjustments include changes in the strength of *convection*, precipitation
16 efficiency, cloud fraction, *lifetime* or water content of clouds, and the formation or suppression of clouds in
17 remote areas due to altered circulations. See also *Aerosol-radiation interaction*.

18
19 *Instantaneous radiative forcing (or effect) due to aerosol-cloud interactions (IRF_{aci})* The radiative forcing
20 (or radiative effect, if the perturbation is internally generated) due to the change in number or size
21 distribution of cloud droplets or ice crystals that is the proximate result of an aerosol perturbation, with other
22 variables (in particular total cloud water content) remaining equal. In liquid clouds, an increase in cloud
23 droplet concentration and surface area would increase the cloud albedo. This effect is also known as the
24 cloud albedo effect, first indirect effect, or Twomey effect. It is a largely theoretical concept that cannot
25 readily be isolated in observations or comprehensive process models due to the ubiquity of adjustments.

26
27 **Aerosol-radiation interaction** An interaction of *aerosol* directly with radiation produce *radiative effects*.
28 In this report two levels of *radiative forcing* (or effect) are distinguished:

29
30 *Aerosol effective radiative forcing (ERF_{ari+aci})* The total effective radiative forcing due to both aerosol-
31 cloud and aerosol-radiation interactions is denoted aerosol effective radiative forcing (ERF_{ari+aci}).

32
33 *Effective radiative forcing (or effect) due to aerosol-radiation interactions (ERF_{ari})* The final radiative
34 forcing (or effect) from the aerosol perturbation including adjustments to the initial change in radiation.
35 These adjustments include changes in cloud caused by the impact of the radiative heating on convective or
36 larger-scale atmospheric circulations, traditionally known as semi-direct aerosol forcing (or effect). See also
37 *Aerosol-cloud interaction*.

38
39 *Instantaneous radiative forcing (or effect) due to aerosol-radiation interactions (IRF_{ari})* The radiative
40 forcing (or radiative effect, if the perturbation is internally generated) of an aerosol perturbation due directly
41 to aerosol-radiation interactions, with all environmental variables remaining unaffected. Traditionally known
42 in the literature as the direct aerosol forcing (or effect).

43
44 **Afforestation** Conversion to *forest* of land that historically has not contained forests. [Note: For a
45 discussion of the term forest and related terms such as afforestation, reforestation and deforestation, see the
46 2006 IPCC Guidelines for National Greenhouse Gas Inventories and their 2019 Refinement, and information
47 provided by the United Nations Framework Convention on Climate Change (IPCC, 2006, 2019, UNFCCC,
48 2021a, 2021b).] See also *Deforestation, Reducing Emissions from Deforestation and Forest Degradation*
49 *(REDD+)*, *Reforestation*, *Anthropogenic removals* and *Carbon dioxide removal (CDR)*.

50
51 **Agreement** In this report, the degree of agreement within the scientific body of knowledge on a particular
52 finding is assessed based on multiple lines of *evidence* (e.g., mechanistic understanding, theory, data,
53 models, expert judgement) and expressed qualitatively (Mastrandrea et al., 2010). See also *Confidence*,
54 *Likelihood*, *Uncertainty* and *Evidence*.

1 **Agricultural or ecological drought** See *Drought*.

2
3 **Air mass** A widespread body of air, the approximately homogeneous properties of which (1) have been
4 established while that air was situated over a particular *region* of the Earth's surface, and (2) undergo specific
5 modifications while in transit away from the source region (AMS, 2021).

6
7 **Air pollution** Degradation of air quality with negative effects on human health or the natural or built
8 environment due to the introduction, by natural processes or human activity, into the *atmosphere* of
9 substances (gases, *aerosols*) which have a direct (primary pollutants) or indirect (secondary pollutants)
10 harmful effect. See also *Short-lived climate forcers (SLCFs)*.

11
12 **Airborne fraction** The fraction of total CO_2 emissions (from fossil fuel and land use change) remaining in
13 the *atmosphere*.

14
15 **Albedo** The proportion of sunlight (*solar radiation*) reflected by a surface or object, often expressed as a
16 percentage. Clouds, snow and ice usually have high albedo; soil surfaces cover the albedo range from high to
17 low; vegetation in the dry season and/or in *arid zones* can have high albedo, whereas photosynthetically
18 active vegetation and the *ocean* have low albedo. The Earth's planetary albedo changes mainly through
19 changes in cloudiness and of snow, ice, leaf area and *land cover*.

20
21 **Alkalinity** See *Total alkalinity*.

22
23 **Altimetry** A technique for measuring the height of the Earth's surface with respect to the geocentre of the
24 Earth within a defined terrestrial reference frame (geocentric sea level).

25
26 **Annular modes** Hemispheric scale patterns of atmospheric variability characterized by opposing and
27 synchronous fluctuations in sea-level pressure between the polar caps and midlatitudes, with a structure
28 exhibiting a high degree of zonal symmetry, and with no real preferred timescales ranging from days to
29 decades. In each hemisphere, these fluctuations reflect changes in the latitudinal position and strength of the
30 mid-latitude jets and associated storm tracks. Annular modes are defined as the leading mode of variability
31 of extratropical sea-level pressure or geopotential heights and are known as the *Northern Annular Mode*
32 (*NAM*) and *Southern Annular Mode (SAM)* in the two hemispheres, respectively.

33
34 *Northern Annular Mode (NAM)* A see-saw latitudinal fluctuation in Northern Hemisphere sea-level
35 pressure or geopotential height between the Arctic and the mid-latitudes. The NAM has some links with the
36 *stratospheric polar vortex* and is related to the fluctuation in strength and latitude of the mean westerlies. Its
37 variance is maximum in winter and its pattern has a strong regional expression in the North Atlantic being
38 strongly correlated with the *North Atlantic Oscillation* index. The NAM is also known as the Arctic
39 Oscillation (AO). In its positive phase, the NAM is characterized by anomalously low pressure over the
40 Arctic and high pressure over the mid-latitudes/subtropics, with a strengthening of the zonally averaged
41 westerly winds on their polar flank that confines colder air across the Arctic. The negative NAM phase is
42 characterized by a more distorted wind pattern and jet meanders which increases storminess in the
43 midlatitude regions. See Section AIV.2.1 in Annex IV of the AR6 WGI report.

44
45 *Southern Annular Mode (SAM)* The leading mode of *climate variability* of Southern Hemisphere sea-level
46 pressure and geopotential height, which is associated with the strength and latitudinal shifts in the mid- to
47 high-latitudes westerly wind belt. The SAM is also known as the Antarctic Oscillation (AAO). A positive
48 SAM phase is defined as lower-than-normal pressures over the polar regions and higher-than-normal
49 pressures in the southern mid-latitudes, with a contraction towards Antarctica and strengthening of the
50 westerly wind belt. The negative SAM phase exhibits positive high latitude pressure anomalies, negative
51 mid-latitude pressure anomalies and a weaker westerly flow expanded towards the equator. See Section
52 AIV.2.2 in Annex IV of the AR6 WGI report. See also *Annular modes*.

53
54 **Anomaly** The deviation of a variable from its value averaged over a *reference period*.

1 **Antarctic amplification** See *Polar amplification*.

2
3 **Antarctic ice sheet (AIS)** See *Ice sheet*.

4
5 **Antarctic oscillation (AAO)** See *Southern Annular Mode (SAM)* (under *Annular modes*).

6
7 **Anthropocene** A proposed new geological epoch resulting from significant human-driven changes to the
8 structure and functioning of the Earth System, including the *climate system*. Originally proposed in the Earth
9 System science community in 2000, the proposed new epoch is undergoing a formalization process within
10 the geological community based on the stratigraphic *evidence* that human activities have changed the Earth
11 System to the extent of forming geological deposits with a signature that is distinct from those of the
12 *Holocene*, and which will remain in the geological record. Both the stratigraphic and Earth System
13 approaches to defining the Anthropocene consider the mid-20th Century to be the most appropriate starting
14 date (Steffen et al., 2016), although others have been proposed and continue to be discussed. The
15 Anthropocene concept has already been informally adopted by diverse disciplines and the public to denote
16 the substantive influence of humans on the Earth System.

17
18 **Anthropogenic** Resulting from or produced by human activities.

19
20 **Anthropogenic emissions** Emissions of *greenhouse gases (GHGs)*, precursors of GHGs and *aerosols*
21 caused by human activities. These activities include the burning of *fossil fuels*, *deforestation*, *land use and*
22 *land use changes (LULUC)*, livestock production, fertilisation, waste management, and industrial processes.
23 See also *Anthropogenic* and *Anthropogenic removals*.

24
25 **Anthropogenic removals** The withdrawal of greenhouse gases (GHGs) from the atmosphere as a result of
26 deliberate human activities. These include enhancing biological sinks of CO₂ and using chemical engineering
27 to achieve long term removal and storage. Carbon capture and storage (CCS), which alone does not remove
28 CO₂ from the atmosphere, can help reduce atmospheric CO₂ from industrial and energy-related sources if it
29 is combined with bioenergy production (BECCS), or if CO₂ is captured from the air directly and stored
30 (DACCS). [Note: In the 2006 IPCC Guidelines for national GHG Inventories (IPCC, 2006), which are used
31 in reporting of emissions to the UNFCCC, ‘anthropogenic’ land-related GHG fluxes are defined as all those
32 occurring on ‘managed land’, i.e. ‘where human interventions and practices have been applied to perform
33 production, ecological or social functions’. However, some removals (e.g. removals associated with CO₂
34 fertilisation and N deposition) are not considered as ‘anthropogenic’, or are referred to as ‘indirect’
35 anthropogenic effects, in some of the scientific literature assessed in this report. As a consequence, the land-
36 related net GHG emission estimates from global models included in this report are not necessarily directly
37 comparable with LULUCF estimates in national GHG Inventories.] See also *Carbon dioxide removal*
38 *(CDR)*, *Afforestation*, *Biochar*, *Enhanced weathering*, *Ocean alkalisation / Ocean alkalinity enhancement*,
39 *Reforestation* and *Soil carbon sequestration (SCS)*.

40
41 **Anthropogenic subsidence** Downward motion of the land surface induced by anthropogenic drivers (e.g.,
42 loading, extraction of hydrocarbons and/or groundwater, drainage, mining activities) causing sediment
43 compaction or subsidence/deformation of the sedimentary sequence, or oxidation of organic material,
44 thereby leading to relative sea level rise.

45
46 **Apparent hydrological sensitivity (η_a)** The change in global mean precipitation per degree Celsius of
47 global mean temperature change with units of % per °C although can also be calculated as W m⁻² per °C. See
48 also *Hydrological sensitivity (η)*.

49
50 **Arctic amplification** See *Polar amplification*.

51
52 **Arid zone** Areas where vegetation growth is severely constrained due to limited water availability. For the
53 most part, the native vegetation of arid zones is sparse. There is high rainfall variability, with annual
54 averages below 300 mm. Crop farming in arid zones requires irrigation.

1 **Aridity** The state of a long-term climatic feature characterised by low average precipitation or available
2 water in a region. Aridity generally arises from widespread persistent *atmospheric* subsidence or anticyclonic
3 conditions, and from more localised subsidence in the lee side of mountains (adapted from Gbeckor-Kove,
4 1989; Türkeş, 1999). See also *Drought*.

5
6 **Artificial ocean upwelling (AOU_{pw})** Artificial ocean upwelling (AOU_{pw}) is a potential carbon dioxide
7 removal method that aims to artificially pump up cooler, nutrient-rich waters from deep in the ocean to the
8 surface. The aim is to stimulate phytoplankton activity and thereby increase ocean CO₂ uptake.

9
10 **Assets** Natural or human-made resources that provide current or future utility, benefit, economic or
11 intrinsic value to natural or human systems.

12
13 **Atlantic Equatorial Mode** See *Atlantic Zonal Mode (AZM)* (under *Tropical Atlantic Variability (TAV)*).

14
15 **Atlantic Meridional Mode (AMM)** See *Tropical Atlantic Variability (TAV)*.

16
17 **Atlantic Meridional Overturning Circulation (AMOC)** See *Meridional overturning circulation (MOC)*.

18
19 **Atlantic Multidecadal Oscillation (AMO)** See *Atlantic Multidecadal Variability (AMV)*.

20
21 **Atlantic Multidecadal Variability (AMV)** Large-scale fluctuations observed from one decade to the next
22 in a variety of instrumental records and *proxy* reconstructions over the entire North Atlantic ocean and
23 surrounding continents. Fingerprints of Atlantic Multidecadal Variability (AMV) can be found at the surface
24 ocean, which is characterized by swings in basin-scale *sea surface temperature* anomalies reflecting the
25 interaction with the *atmosphere*. The positive phase of the AMV is characterized by anomalous warming
26 over the entire North Atlantic, with the strongest amplitude in the subpolar gyre and along sea-ice margin
27 zones in the Labrador Sea and Greenland/Barents Sea and in the subtropical North Atlantic basin to a lower
28 extent. In the AR6 WGI report, the term AMV is preferred to Atlantic Multidecadal Oscillation (AMO) used
29 in previous IPCC reports because there is no preferred timescale of decadal variability as the term oscillation
30 would indirectly implied. See Section AIV.2.7 in Annex IV of the AR6 WGI report.

31
32 **Atlantic Niño** See *Atlantic Zonal Mode (AZM)* (under *Tropical Atlantic Variability (TAV)*).

33
34 **Atlantic Zonal Mode (AZM)** See *Tropical Atlantic Variability (TAV)*.

35
36 **Atmosphere** The gaseous envelope surrounding the Earth, divided into five layers – the *troposphere* which
37 contains half of the Earth's atmosphere, the *stratosphere*, the mesosphere, the thermosphere, and the
38 exosphere, which is the outer limit of the atmosphere. The dry atmosphere consists almost entirely of
39 nitrogen (78.1% volume mixing ratio) and oxygen (20.9% volume mixing ratio), together with a number of
40 trace gases, such as argon (0.93 % volume mixing ratio), helium and radiatively active *greenhouse gases*
41 (*GHGs*) such as *carbon dioxide (CO₂)* (0.04% volume mixing ratio), *methane (CH₄)*, *nitrous oxide (N₂O)*
42 and *ozone (O₃)*. In addition, the atmosphere contains the GHG water vapour (H₂O), whose concentrations are
43 highly variable (0-5% volume mixing ratio) as the sources (*evapotranspiration*) and sinks (precipitation) of
44 water vapour show large spatio-temporal variations, and atmospheric temperature exerts a strong constraint
45 on the amount of water vapour an air parcel can hold. The atmosphere also contains clouds and *aerosols*. See
46 also *Hydrological cycle*, *Stratosphere* and *Troposphere*.

47
48 **Atmosphere-ocean general circulation model (AOGCM)** See *General circulation model (GCM)*.

49
50 **Atmospheric boundary layer** The atmospheric layer adjacent to the Earth's surface that is affected by
51 friction against that boundary surface, and possibly by transport of heat and other variables across that
52 surface (AMS, 2021). The lowest 100 m of the boundary layer (about 10% of the boundary layer thickness),
53 where mechanical generation of turbulence is dominant, is called the surface boundary layer or surface layer.

54
55 **Atmospheric lifetime** See *Lifetime*.

- 1
2 **Atmospheric rivers (ARs)** Long, narrow (up to a few hundred km wide), shallow (up to a few km deep)
3 and transient corridors of strong horizontal water vapour transport that are typically associated with a low-
4 level jet stream ahead of the cold front of an *extratropical cyclone* (Ralph et al., 2018).
5
6 **Attribution** Attribution is defined as the process of evaluating the relative contributions of multiple causal
7 factors to a change or event with an assessment of confidence.
8
9 **Australian and Maritime Continent monsoon (AusMCM)** See *Global monsoon*.
10
11 **Autotrophic respiration** Respiration by photosynthetic (see *photosynthesis*) organisms (e.g., plants and
12 algae).
13
14 **Avalanche** A mass of snow, ice, earth or rocks, or a mixture of these, falling down a mountainside.
15
16 **Barystatic** See *Sea level change (sea level rise/sea level fall)*.
17
18 **Basal lubrication** Reduction of friction at the base of an *ice sheet* or *glacier* due to lubrication by
19 meltwater. This can allow the glacier or ice sheet to slide over its base. Meltwater may be produced by
20 pressure-induced melting, friction or geothermal heat, or surface melt may drain to the base through holes in
21 the ice.
22
23 **Baseline/reference** The baseline (or reference) is the state against which change is measured. See *Baseline*
24 *scenario* (under *Scenario*) and *Baseline/reference (period)*. See also *Baseline period* (under *Reference*
25 *period*) and *Reference period*.
26
27 **Baseline period** See *Reference period*.
28
29 **Baseline scenario** See *Scenario*.
30
31 **Bifurcation point** See *Tipping point*.
32
33 **Biodiversity** Biodiversity or biological diversity means the variability among living organisms from all
34 sources including, among other things, terrestrial, marine and other aquatic *ecosystems*, and the ecological
35 complexes of which they are part; this includes diversity within species, between species, and of ecosystems
36 (UN, 1992). See also *Ecosystem* and *Ecosystem services*.
37
38 **Bioenergy with carbon dioxide capture and storage (BECCS)** Carbon dioxide capture and storage
39 (CCS) technology applied to a *bioenergy* facility. Note that depending on the total emissions of the BECCS
40 supply chain, *carbon dioxide (CO₂)* can be removed from the *atmosphere*. See also *Bioenergy*, *Carbon*
41 *dioxide capture and storage (CCS)*, *Anthropogenic removals* and *Carbon dioxide removal (CDR)*.
42
43 **Biogenic volatile organic compounds (BVOCs)** See *Volatile organic compounds (VOCs)*.
44
45 **Biogeophysical potential** See *Mitigation potential*.
46
47 **Biological (carbon) pump** A series of *ocean* processes through which inorganic carbon (as *carbon*
48 *dioxide, CO₂*) is fixed as organic matter by photosynthesis in sunlit surface water and then transported to the
49 ocean interior, and possibly the sediment, resulting in the storage of carbon.
50 **Biomass** Organic material excluding the material that is fossilised or embedded in geological formations.
51 Biomass may refer to the mass of organic matter in a specific area (ISO, 2014). See also *Bioenergy* and
52 *Biofuel*.
53
54 **Biosphere (terrestrial and marine)** The part of the Earth System comprising all *ecosystems* and living
55 organisms, in the *atmosphere*, on land (terrestrial biosphere) or in the oceans (marine biosphere), including

1 derived dead organic matter, such as litter, soil organic matter and oceanic detritus.

2
3 **Bipolar seesaw (also interhemispheric seesaw, interhemispheric asymmetry, hemispheric asymmetry)**
4 A phenomenon in which temperature changes in the northern and southern hemispheres are related but out of
5 phase, generally inferred to represent a change in the magnitude or sign of net heat transport across the
6 equator. Originally called hemispheric asymmetry and linked to changes in thermohaline overturning
7 circulation on multi-millennial scales (Mix et al., 1986), later named bipolar seesaw and applied to millennial
8 scales (Broecker, 1998) with a similar thermohaline mechanism (Stocker and Johnsen, 2003). See also
9 *Meridional overturning circulation (MOC)* and *Deglacial or deglaciation or glacial termination*.

10
11 **Black carbon (BC)** A relatively pure form of carbon, also known as soot, arising from the incomplete
12 combustion of fossil fuels, biofuel, and biomass. It only stays in the atmosphere for days or weeks. BC is a
13 climate forcing agent with strong warming effect, both in the atmosphere and when deposited on snow or
14 ice. See also *Aerosol* and *Atmosphere*.

15
16 **Blocking** Associated with persistent, slow-moving high-pressure systems that obstruct the prevailing
17 westerly winds in the middle and high latitudes and the normal eastward progress of extratropical transient
18 storm systems. It is an important component of the intraseasonal *climate variability* in the extratropics and
19 can cause long-lived weather conditions such as cold spells in winter and summer *heat waves*.

20
21 **Blue carbon** Biologically-driven carbon fluxes and storage in marine systems that are amenable to
22 management. Coastal blue carbon focuses on rooted vegetation in the coastal zone, such as tidal marshes,
23 mangroves and seagrasses. These *ecosystems* have high carbon burial rates on a per unit area basis and
24 accumulate carbon in their soils and sediments. They provide many non-climatic benefits and can contribute
25 to ecosystem-based adaptation. If degraded or lost, coastal blue carbon ecosystems are likely to release most
26 of their carbon back to the *atmosphere*. There is current debate regarding the application of the blue carbon
27 concept to other coastal and non-coastal processes and ecosystems, including the open *ocean*. See also
28 *Ecosystem services* and *Sequestration*.

29
30 **Brewer-Dobson circulation** The meridional overturning circulation of the *stratosphere* transporting air
31 upward in the tropics, poleward to the winter hemisphere, and downward at polar and subpolar latitudes. The
32 Brewer-Dobson circulation is driven by the interaction between upward propagating planetary waves and the
33 mean flow.

34
35 **Burden** The total mass of a substance of concern in the *atmosphere*.

36
37 **Business as usual (BAU)** The term business as usual scenario has been used to describe a scenario that
38 assumes no additional policies beyond those currently in place and that patterns of socio-economic
39 development are consistent with recent trends. The term is now used less frequently than in the past. See
40 also *Reference scenario* (under *Scenario*).

41
42 ¹³C Stable *isotope* of carbon having an atomic weight of approximately 13. Measurements of the ratio of
43 ¹³C/¹²C in *carbon dioxide* molecules are used to infer the importance of different *carbon cycle* and *climate*
44 processes and the size of the terrestrial carbon *reservoir*.

45
46 ¹⁴C Unstable *isotope* of carbon having an atomic weight of approximately 14, and a half-life of about 5700
47 years. It is often used for dating purposes going back some 40 kyr. Its variation in time is affected by the
48 magnetic fields of the Sun and Earth, which influence its production from cosmic rays (see *Cosmogenic*
49 *radioisotopes*).

50
51 **Calcification** The process of biologically precipitating calcium carbonate minerals to create organism
52 shells, skeletons, otoliths, or other body structures. The chemical equation describing calcification is Ca^{2+}
53 (aq) + 2HCO₃⁻ (aq) → CaCO₃(s) + CO₂ + H₂O. Aragonite and calcite are two common crystalline forms of
54 biologically precipitated calcium carbonate minerals that have different solubilities.

1 **Calving (of glaciers or ice sheets)** The breaking off of discrete pieces of ice from a *glacier*, *ice sheet* or an
2 *ice shelf* into lake or seawater, producing *icebergs*. This is a form of mass loss from an ice body.

3
4 **Canopy temperature** The temperature within the canopy of a vegetation structure.

5
6 **Carbon budget** Refers to two concepts in the literature: (1) an assessment of carbon cycle *sources* and
7 *sinks* on a global level, through the synthesis of evidence for *fossil-fuel* and cement emissions, emissions and
8 removals associated with *land use* and *land use change*, ocean and natural land sources and sinks of *carbon*
9 *dioxide (CO₂)*, and the resulting change in atmospheric CO₂ concentration. This is referred to as the Global
10 Carbon Budget; (2) the maximum amount of cumulative net global *anthropogenic* CO₂ emissions that would
11 result in limiting *global warming* to a given level with a given probability, taking into account the effect of
12 other anthropogenic climate *forcers*. This is referred to as the Total Carbon Budget when expressed starting
13 from the *pre-industrial* period, and as the Remaining Carbon Budget when expressed from a recent specified
14 date.

15
16 Note 1: Net anthropogenic CO₂ emissions are anthropogenic CO₂ emissions minus anthropogenic CO₂
17 removals. See also *Carbon Dioxide Removal (CDR)*.

18
19 Note 2: The maximum amount of cumulative net global anthropogenic CO₂ emissions is reached at the time
20 that annual net anthropogenic CO₂ emissions reach zero.

21
22 Note 3: The degree to which anthropogenic climate forcings other than CO₂ affect the Total Carbon Budget
23 and Remaining Carbon Budget depends on human choices about the extent to which these forcings are
24 mitigated and their resulting *climate* effects.

25
26 Note 4: The notions of a Total Carbon Budget and Remaining Carbon Budget are also being applied in parts
27 of the scientific literature and by some entities at regional, national, or sub-national level. The distribution of
28 global budgets across individual different entities and emitters depends strongly on considerations of equity
29 and other value judgements.

30
31 **Carbon cycle** The flow of carbon (in various forms, e.g., as *carbon dioxide (CO₂)*, carbon in biomass, and
32 carbon dissolved in the ocean as carbonate and bicarbonate) through the atmosphere, hydrosphere, terrestrial
33 and marine biosphere and lithosphere. In this report, the reference unit for the global carbon cycle is GtCO₂
34 or GtC (one Gigatonne = 1 Gt = 10¹⁵ grams; 1GtC corresponds to 3.667 GtCO₂).

35
36 **Carbon dioxide (CO₂)** A naturally occurring gas, CO₂ is also a by-product of burning fossil fuels (such as
37 oil, gas and coal), of burning *biomass*, of *land use* changes (LUC) and of industrial processes (e.g., cement
38 production). It is the principal *anthropogenic* greenhouse gas (GHG) that affects the Earth's radiative
39 balance. It is the reference gas against which other GHGs are measured and therefore has a Global Warming
40 Potential (GWP) of 1. See also *Land use* and *Land-use change (LUC)*.

41
42 **Carbon dioxide (CO₂) fertilisation** The increase of plant photosynthesis and water-use efficiency in
43 response to increased atmospheric *carbon dioxide (CO₂)* concentration. Whether this increased
44 photosynthesis translates into increased plant growth and carbon storage on land depends on the interacting
45 effects of temperature, moisture and nutrient availability.

46
47 **Carbon dioxide capture and storage (CCS)** A process in which a relatively pure stream of *carbon*
48 *dioxide (CO₂)* from industrial and energy-related sources is separated (captured), conditioned, compressed
49 and transported to a storage location for long-term isolation from the *atmosphere*. Sometimes referred to as
50 Carbon Capture and Storage. See also *Bioenergy with carbon dioxide capture and storage (BECCS)*, *Carbon*
51 *dioxide capture and utilisation (CCU)*, *Sequestration*, *Anthropogenic removals* and *Carbon dioxide removal*
52 *(CDR)*.

53
54 **Carbon dioxide removal (CDR)** *Anthropogenic* activities removing *carbon dioxide (CO₂)* from the
55 *atmosphere* and durably storing it in geological, terrestrial, or *ocean* reservoirs, or in products. It includes

1 existing and potential anthropogenic enhancement of biological or geochemical CO₂ *sinks* and direct air
2 capture and storage, but excludes natural CO₂ *uptake* not directly caused by human activities. See also
3 *Anthropogenic removals, Afforestation, Biochar, Enhanced weathering, Ocean alkalisation / Ocean*
4 *alkalinity enhancement, Reforestation, Soil carbon sequestration (SCS), Bioenergy with carbon dioxide*
5 *capture and storage (BECCS) and Carbon dioxide capture and storage (CCS).*

6
7 **Carbon neutrality** Condition in which anthropogenic CO₂ emissions associated with a subject are
8 balanced by anthropogenic CO₂ removals. The subject can be an entity such as a country, an organisation, a
9 district or a commodity, or an activity such as a service and an event. Carbon neutrality is often assessed
10 over the life cycle including indirect (“scope 3”) emissions, but can also be limited to the emissions and
11 removals, over a specified period, for which the subject has direct control, as determined by the relevant
12 scheme.

13
14 Note 1: Carbon neutrality and *net zero CO₂ emissions* are overlapping concepts. The concepts can be applied
15 at global or sub-global scales (e.g., regional, national and sub-national). At a global scale, the terms carbon
16 neutrality and net zero CO₂ emissions are equivalent. At sub-global scales, net zero CO₂ emissions is
17 generally applied to emissions and removals under direct control or territorial responsibility of the reporting
18 entity, while carbon neutrality generally includes emissions and removals within and beyond the direct
19 control or territorial responsibility of the reporting entity. Accounting rules specified by GHG programmes
20 or schemes can have a significant influence on the quantification of relevant CO₂ emissions and removals.

21
22 Note 2: In some cases achieving carbon neutrality may rely on the supplementary use of *offsets* to balance
23 emissions that remain after actions by the reporting entity are taken into account.

24
25 See also *Greenhouse gas neutrality, Land use, land-use change and forestry (LULUCF) and Net zero CO₂*
26 *emissions.*

27
28 **Carbon sequestration** See *Sequestration*.

29
30 **Carbon sink** See *Sink*.

31
32 **Carbon source** See *Source*.

33
34 **Carbon-climate feedback** See *Climate-carbon cycle feedback*.

35
36 **Carbonaceous aerosol** Aerosol consisting predominantly of organic substances and *black carbon*.

37
38 **Carbonate counter pump** See *Carbonate pump*.

39
40 **Carbonate pump** Ocean carbon fixation through the biological formation of carbonates, primarily by
41 plankton that generate bio-mineral particles that sink to the *ocean* interior, and possibly the sediment. It is
42 also called carbonate counter-pump, since the formation of calcium carbonate (CaCO₃) is accompanied by
43 the release of *carbon dioxide (CO₂)* to surrounding water and subsequently to the *atmosphere*.

44
45 **Catchment** An area that collects and drains precipitation.

46
47 **Cenozoic Era** The third and current geological Era, which began 66.0 Ma. It comprises the Paleogene,
48 Neogene and Quaternary Periods.

49
50 **Central Pacific El Niño** See *El Niño-Southern Oscillation (ENSO)*.

51
52 **Chaotic** A *dynamical system* such as the *climate system*, governed by nonlinear deterministic equations
53 (see *Nonlinearity*), may exhibit erratic or chaotic behaviour in the sense that very small changes in the initial
54 state of the system in time lead to large and apparently unpredictable changes in its temporal evolution. Such
55 chaotic behaviour limits the *predictability* of the state of a nonlinear dynamical system at specific future

1 times, although changes in its statistics may still be predictable given changes in the system parameters or
2 boundary conditions.

3
4 **Charcoal** Material resulting from charring of *biomass*, usually retaining some of the microscopic texture
5 typical of plant tissues; chemically it consists mainly of carbon with a disturbed graphitic structure, with
6 lesser amounts of oxygen and hydrogen.

7
8 **Chlorofluorocarbons (CFCs)** A chlorofluorocarbon is an organic compound that contains chlorine,
9 carbon, hydrogen, and fluorine and is used for refrigeration, air conditioning, packaging, plastic foam,
10 insulation, solvents, or aerosol propellants. Because they are not destroyed in the lower atmosphere, CFCs
11 drift into the upper atmosphere where, given suitable conditions, they break down ozone (O₃). It is one of the
12 greenhouse gases (GHGs) covered under the 1987 Montreal Protocol as a result of which manufacturing of
13 these gases has been phased out and they are being replaced by other compounds, including
14 hydrofluorocarbons (HFCs) which are GHGs covered under the Kyoto Protocol.

15
16 **Chronology** Arrangement of events according to dates or times of occurrence.

17
18 **Cirrus cloud thinning (CCT)** See *Solar radiation modification (SRM)*.

19
20 **Clathrate (methane)** A partly frozen slushy mix of *methane* gas and ice, usually found in sediments.

21
22 **Clausius-Clapeyron equation/relationship** The thermodynamic relationship between temperature and the
23 vapour pressure of a substance in which two phases of the substance are in equilibrium (e.g., liquid water
24 and *water vapour*). For gases such as water vapour, this relation gives the increase in equilibrium (or
25 saturation) vapour pressure per unit change in air temperature.

26
27 **Climate** Climate in a narrow sense is usually defined as the average weather, or more rigorously, as the
28 statistical description in terms of the mean and variability of relevant quantities over a period of time ranging
29 from months to thousands or millions of years. The classical period for averaging these variables is 30 years,
30 as defined by the World Meteorological Organization (WMO). The relevant quantities are most often surface
31 variables such as temperature, precipitation and wind. Climate in a wider sense is the state, including a
32 statistical description, of the *climate system*.

33
34 **Climate change** A change in the state of the *climate* that can be identified (e.g., by using statistical tests)
35 by changes in the mean and/or the variability of its properties and that persists for an extended period,
36 typically decades or longer. Climate change may be due to natural internal processes or external *forcings*
37 such as modulations of the solar cycles, volcanic eruptions and persistent *anthropogenic* changes in the
38 composition of the *atmosphere* or in *land use*. Note that the *United Nations Framework Convention on*
39 *Climate Change (UNFCCC)*, in its Article 1, defines climate change as: 'a change of climate which is
40 attributed directly or indirectly to human activity that alters the composition of the global atmosphere and
41 which is in addition to natural climate variability observed over comparable time periods'. The UNFCCC
42 thus makes a distinction between climate change attributable to human activities altering the atmospheric
43 composition and *climate variability* attributable to natural causes. See also *Climate variability, Detection and*
44 *attribution, Global warming* and *Ocean acidification (OA)*.

45
46 **Climate change commitment** Climate change commitment is defined as the unavoidable future *climate*
47 *change* resulting from inertia in the geophysical and socio-economic systems. Different types of climate
48 change commitment are discussed in the literature (see subterms). Climate change commitment is usually
49 quantified in terms of the further change in temperature, but it includes other future changes, for example in
50 the *hydrological cycle*, in *extreme weather events*, in extreme climate events, and in sea level.

51
52 *Constant composition commitment* The constant composition commitment is the remaining *climate change*
53 that would result if atmospheric composition, and hence *radiative forcing*, were held fixed at a given value.
54 It results from the thermal inertia of the ocean and slow processes in the cryosphere and land surface.

1 **Constant emissions commitment** The constant emissions commitment is the committed *climate change* that
2 would result from keeping *anthropogenic emissions* constant.

3
4 **Zero emissions commitment** The zero emissions commitment is an estimate of the subsequent *global*
5 *warming* that would result after *anthropogenic emissions* are set to zero. It is determined by both inertia in
6 physical *climate system* components (*ocean, cryosphere, land surface*) and *carbon cycle* inertia. In its widest
7 sense it refers to emissions of each climate *forcer* including *greenhouses gases, aerosols* and their pre-
8 cursors. The climate response to this can be complex due to the different timescale of response of each
9 climate forcer. A specific sub-category of zero emissions commitment is the Zero CO₂ Emissions
10 Commitment which refers to the climate system response to CO₂ emissions after setting these to net zero.
11 The CO₂-only definition is of specific use in estimating *remaining carbon budgets*.

12
13 **Climate extreme (extreme weather or climate event)** The occurrence of a value of a weather or *climate*
14 variable above (or below) a threshold value near the upper (or lower) ends of the range of observed values of
15 the variable. By definition, the characteristics of what is called *extreme weather* may vary from place to
16 place in an absolute sense. When a pattern of extreme weather persists for some time, such as a season, it
17 may be classified as an extreme climate event, especially if it yields an average or total that is itself extreme
18 (e.g., high temperature, *drought*, or heavy rainfall over a season). For simplicity, both extreme weather
19 events and extreme climate events are referred to collectively as 'climate extremes'.

20
21 **Climate feedback** An interaction in which a perturbation in one *climate* quantity causes a change in a
22 second and the change in the second quantity ultimately leads to an additional change in the first. A negative
23 feedback is one in which the initial perturbation is weakened by the changes it causes; a positive feedback is
24 one in which the initial perturbation is enhanced. The initial perturbation can either be externally forced or
25 arise as part of internal variability. See also *Climate-carbon cycle feedback, Cloud feedback* and *Ice-albedo*
26 *feedback*.

27
28 **Climate feedback parameter** A way to quantify the radiative response of the *climate system* to a global
29 surface temperature change induced by a *radiative forcing*. It is quantified as the change in net energy flux at
30 the top of atmosphere for a given change in annual global surface temperature. It has units of W m⁻² °C⁻¹.

31
32 **Climate forecast** See *Climate prediction*.

33
34 **Climate index** A time series constructed from climate variables that provides an aggregate summary of the
35 state of the *climate system*. For example, the difference between sea level pressure in Iceland and the Azores
36 provides a simple yet useful historical *NAO* index. Because of their optimal properties, climate indices are
37 often defined using *principal components* – linear combinations of climate variables at different locations
38 that have maximum variance subject to certain normalisation constraints (e.g., the *NAM* and *SAM* indices
39 which are principal components of Northern Hemisphere and Southern Hemisphere gridded pressure
40 anomalies, respectively). Definitions of observational indices for Modes of variability can be found in the
41 Annex VI.

42
43 **Climate indicator** Measures of the *climate system* including large-scale variables and climate *proxies*. See
44 also *Global surface temperature indicators* and *Climate metrics*.

45
46 **Key climate indicators** Key indicators constitute a finite set of distinct variables that may collectively point
47 to important overall changes in the *climate system* of broad societal relevance across the atmospheric,
48 oceanic, cryospheric and biospheric domains, with land as an implicit cross-cutting theme. Taken together,
49 these indicators would be expected to both have changed and continue to change in the future in a coherent
50 and consistent manner. See Cross-Chapter Box 2.2, Table 1 in the AR6 WGI report.

51
52 **Climate information** Information about the past, current state, or future of the *climate system* that is
53 relevant for *mitigation, adaptation* and *risk management*. It may be tailored or “co-produced” for specific
54 contexts, taking into account users' needs and values.

1 **Climate metrics** Measures of aspects of the overall *climate system* response to *radiative forcing*, such as
2 *equilibrium climate sensitivity (ECS)*, *transient climate response (TCR)*, *transient climate response to*
3 *cumulative CO₂ emissions (TCRE)* and the airborne fraction of *anthropogenic* carbon dioxide. See also
4 *Greenhouse gas emission metric*, *Climate indicator* and *Key climate indicators* (under *Climate indicator*).
5

6 **Climate model** A qualitative or quantitative representation of the climate system based on the physical,
7 chemical and biological properties of its components, their interactions and feedback processes and
8 accounting for some of its known properties. The climate system can be represented by models of varying
9 complexity; that is, for any one component or combination of components a spectrum or hierarchy of models
10 can be identified, differing in such aspects as the number of spatial dimensions, the extent to which physical,
11 chemical or biological processes are explicitly represented, or the level at which empirical parametrisations
12 are involved. There is an evolution towards more complex models with interactive chemistry and biology.
13 Climate models are applied as a research tool to study and simulate the climate and for operational purposes,
14 including monthly, seasonal and interannual climate predictions. See also *Chemistry-climate model*, *Earth*
15 *system model (ESM)*, *Earth system model of intermediate complexity (EMIC)*, *Energy balance model (EBM)*,
16 *Simple climate model (SCM)*, *Regional climate model (RCM)*, *Dynamic global vegetation model (DGVM)*,
17 *General circulation model (GCM)* and *Emulators*.
18

19 **Climate pattern** A set of spatially varying coefficients obtained by “projection” (regression) of *climate*
20 variables onto a *climate index* time series. When the climate index is a principal component, the climate
21 pattern is an eigenvector of the covariance matrix, referred to as an Empirical Orthogonal Function (EOF) in
22 climate science.
23

24 **Climate prediction** A climate prediction or climate forecast is the result of an attempt to produce (starting
25 from a particular state of the *climate system*) an estimate of the actual evolution of the climate in the future,
26 for example, at seasonal, interannual or decadal time scales. Because the future evolution of the climate
27 system may be highly sensitive to initial conditions, has chaotic elements and is subject to *natural*
28 *variability*, such predictions are usually probabilistic in nature.
29

30 **Climate projection** Simulated response of the *climate system* to a *scenario* of future emissions or
31 concentrations of *greenhouse gases (GHGs)* and *aerosols* and changes in *land use*, generally derived using
32 *climate models*. Climate projections are distinguished from *climate predictions* by their dependence on the
33 emission/concentration/radiative forcing *scenario* used, which is in turn based on assumptions concerning,
34 for example, future socio-economic and technological developments that may or may not be realised.
35

36 **Climate response** A general term for how the *climate system* responds to a *radiative forcing*.
37

38 **Climate scenario** A plausible and often simplified representation of the future *climate*, based on an
39 internally consistent set of climatological relationships that has been constructed for explicit use in
40 investigating the potential consequences of *anthropogenic* climate change, often serving as input to impact
41 models. *Climate projections* often serve as the raw material for constructing climate scenarios, but climate
42 scenarios usually require additional information such as the observed current climate. See also *Regional*
43 *climate scenario*.
44

45 **Climate sensitivity** The change in the surface temperature in response to a change in the atmospheric
46 carbon dioxide (CO₂) concentration or other radiative forcing. See also *Climate feedback parameter*.
47

48 *Earth system sensitivity* The equilibrium surface temperature response of the coupled *atmosphere-ocean-*
49 *cryosphere-vegetation-carbon cycle* system to a doubling of the atmospheric carbon dioxide (CO₂)
50 concentration is referred to as Earth System sensitivity. Because it allows ice sheets to adjust to the external
51 perturbation, it may differ substantially from the *equilibrium climate sensitivity* derived from coupled
52 atmosphere-ocean models.
53

54 *Equilibrium climate sensitivity (ECS)* The equilibrium (steady state) change in the surface temperature
55 following a doubling of the atmospheric *carbon dioxide (CO₂)* concentration from *pre-industrial* conditions.

1
2 **Transient climate response (TCR)** The surface temperature response for the hypothetical scenario in which
3 atmospheric *carbon dioxide* (CO_2) increases at $1\% \text{ yr}^{-1}$ from *pre-industrial* to the time of a doubling of
4 atmospheric CO_2 concentration (year 70).

5
6 **Transient climate response to cumulative CO_2 emissions (TCRE)** The transient surface temperature change
7 per unit cumulative *carbon dioxide* (CO_2) emissions, usually 1000 GtC. TCRE combines both information
8 on the airborne fraction of cumulative CO_2 emissions (the fraction of the total CO_2 emitted that remains in
9 the *atmosphere*, which is determined by *carbon cycle* processes) and on the *transient climate response*
10 (*TCR*).

11
12 **Climate services** Climate services involve the provision of climate information in such a way as to assist
13 decision-making. The service includes appropriate engagement from users and providers, is based on
14 scientifically credible information and expertise, has an effective access mechanism, and responds to user
15 needs (Hewitt et al., 2012).

16
17 **Climate simulation ensemble** A group of parallel model simulations characterising historical *climate*
18 conditions, *climate predictions*, or *climate projections*. Variation of the results across the ensemble members
19 may give an estimate of modelling-based uncertainty. Ensembles made with the same model but different
20 initial conditions characterise the uncertainty associated with internal *climate variability*, whereas multi-
21 model ensembles including simulations by several models also include the effect of model differences.
22 Perturbed parameter ensembles, in which model parameters are varied in a systematic manner, aim to assess
23 the uncertainty resulting from internal model specifications within a single model. Remaining sources of
24 uncertainty unaddressed with model ensembles are related to systematic model errors or biases, which may
25 be assessed from systematic comparisons of model simulations with observations wherever available.

26
27 **Climate system** The global system consisting of five major components: the *atmosphere*, the *hydrosphere*,
28 the *cryosphere*, the *lithosphere* and the *biosphere* and the interactions between them. The climate system
29 changes in time under the influence of its own internal dynamics and because of *external forcings* such as
30 volcanic eruptions, solar variations, orbital forcing, and *anthropogenic forcings* such as the changing
31 composition of the atmosphere and *land-use change*.

32
33 **Climate threshold** A limit within the *climate system* (or its *forcing*) beyond which the behaviour of the
34 system is qualitatively changed. See also *Abrupt climate change* and *Tipping point*.

35
36 **Climate variability** Deviations of climate variables from a given mean state (including the occurrence of
37 extremes, etc.) at all spatial and temporal scales beyond that of individual weather events. Variability may be
38 intrinsic, due to fluctuations of processes internal to the *climate system* (*internal variability*), or extrinsic, due
39 to variations in natural or anthropogenic *external forcing* (forced variability). See also *Climate change* and
40 *Modes of climate variability*.

41
42 **Decadal variability** Decadal variability refers to *climate variability* on decadal time scales. See also *Pacific*
43 *Decadal Variability (PDV)*, *Atlantic Multi-decadal Oscillation/Variability (AMO/AMV)* and *Pacific Decadal*
44 *Oscillation (PDO)* (under *Pacific Decadal Variability (PDV)*).

45
46 **Internal variability** Fluctuations of the climate dynamical system when subject to a constant or periodic
47 external forcing (such as the annual cycle). See also *Climate variability*.

48
49 **Natural variability** Natural variability refers to climatic fluctuations that occur without any human
50 influence, i.e. *internal variability* combined with the response to external natural factors such as volcanic
51 eruptions, changes in *solar activity* and, on longer time-scales, orbital effects and plate tectonics. See also
52 *Orbital forcing*.

53
54 **Climate velocity** The speed at which isolines of a specified climate variable travel across landscapes or
55 seascapes due to changing climate. For example, climate velocity for temperature is the speed at which

1 isotherms move due to changing climate (km yr^{-1}) and is calculated as the temporal change in temperature
2 ($^{\circ}\text{C yr}^{-1}$) divided by the current spatial gradient in temperature ($^{\circ}\text{C km}^{-1}$). It can be calculated using
3 additional climate variables such as precipitation or can be based on the climatic niche of organisms.
4

5 **Climate-carbon cycle feedback** A *climate feedback* involving changes in the properties of land and ocean
6 *carbon cycle* in response to *climate change*. In the ocean, changes in oceanic temperature and circulation
7 could affect the *atmosphere-ocean CO₂ flux*; on the continents, *climate change* could affect plant
8 *photosynthesis* and soil microbial *respiration* and hence the flux of CO₂ between the *atmosphere* and the
9 land *biosphere*.
10

11 **Climatic impact-driver (CID)** Climatic impact-drivers (CIDs) are physical *climate system* conditions
12 (e.g., means, events, extremes) that affect an element of society or *ecosystems*. Depending on system
13 tolerance, CIDs and their changes can be detrimental, beneficial, neutral, or a mixture of each across
14 interacting system elements and regions. See also *Risk*, *Hazard* and *Impacts (consequences, outcomes)*.
15

16 **Cloud condensation nuclei (CCN)** The subset of *aerosol* particles that serve as an initial site for the
17 condensation of liquid water, which can lead to the formation of cloud droplets, under typical cloud
18 formation conditions. The main factor that determines which *aerosol* particles are CCN at a given
19 supersaturation is their size.
20

21 **Cloud feedback** A climate feedback involving changes in any of the properties of clouds as a response to a
22 change in the local or *global mean surface temperature*. Understanding cloud feedbacks and determining
23 their magnitude and sign require an understanding of how a change in *climate* may affect the spectrum of
24 cloud types, the cloud fraction and height, the radiative properties of clouds, and finally the Earth's radiation
25 budget. At present, cloud feedbacks remain the largest source of *uncertainty* in *climate sensitivity* estimates.
26

27 **Cloud radiative effect** The *radiative effect* of clouds relative to the identical situation without clouds. In
28 previous IPCC reports this was called *cloud radiative forcing*, but that terminology is inconsistent with other
29 uses of the forcing term and is not maintained in this report.
30

31 **Cloud-resolving models (CRMs)** Numerical models that are that are of high enough resolution and have
32 the necessary physics to represent the dynamical and physical processes of cloud formation.
33

34 **CMIP6** See *Coupled Model Intercomparison Project (CMIP)*.
35

36 **CO₂ equivalent (CO₂-eq) emission** The amount of *carbon dioxide (CO₂)* emission that would have an
37 equivalent effect on a specified key measure of *climate change*, over a specified time horizon, as an emitted
38 amount of another *greenhouse gas (GHG)* or a mixture of other GHGs. For a mix of GHGs it is obtained by
39 summing the CO₂-equivalent emissions of each gas. There are various ways and time horizons to compute
40 such equivalent emissions (see *greenhouse gas emission metric*). CO₂-equivalent emissions are commonly
41 used to compare emissions of different GHGs, but should not be taken to imply that these emissions have an
42 equivalent effect across all key measures of climate change. [Note: Under the Paris Rulebook [Decision
43 18/CMA.1, annex, paragraph 37], parties have agreed to use GWP100 values from the IPCC AR5 or
44 GWP100 values from a subsequent IPCC Assessment Report to report aggregate emissions and removals of
45 GHGs. In addition, parties may use other metrics to report supplemental information on aggregate emissions
46 and removals of GHGs.]
47

48 **Coast** The *land* near to the sea. The term ‘coastal’ can refer to that land (e.g., as in ‘coastal communities’),
49 or to that part of the marine environment that is strongly influenced by land-based processes. Thus, coastal
50 seas are generally shallow and near-shore. The landward and seaward limits of the coastal zone are not
51 consistently defined, neither scientifically nor legally. Thus, coastal waters can either be considered as
52 equivalent to territorial waters (extending 12 nautical miles / 22.2 km from mean low water), or to the full
53 Exclusive Economic Zone, or to *shelf seas*, with less than 200 m water depth.
54

55 **Cold days/cold nights** Days where maximum temperature, or nights where minimum temperature, falls

1 below the 10th *percentile*, where the respective temperature distributions are generally defined with respect
2 to the 1961-1990 reference period. For the corresponding indices, see Box 2.4.

3
4 **Common era (CE)** CE (Common Era) and BCE (Before the Common Era) are alternative names for AD
5 (Anno Domini) and BC (Before Christ) in the Gregorian international standard calendar-year system.
6 CE/BCE are preferred in an international context because they are neutral with respect to religion. The
7 numbering of calendar years is the same under both terminologies. The CE began in year AD 1 and extends
8 to the present day.

9
10 **Compatible emissions** Earth System Models that simulate the land and ocean *carbon cycle* can calculate
11 CO₂ emissions that are compatible with a given atmospheric CO₂ concentration trajectory. The compatible
12 emissions over a given period of time are equal to the increase of carbon over that same period of time in the
13 sum of the three active *reservoirs*: the *atmosphere*, the land and the ocean.

14
15 **Compound events** See *Compound weather/climate events*.

16
17 **Compound weather/climate events** The combination of multiple *drivers* and/or *hazards* that contributes
18 to societal and/or environmental *risk* (Zscheischler et al., 2018).

19
20 **Concentrations scenario** See *Scenario*.

21
22 **Confidence** The robustness of a finding based on the type, amount, quality and consistency of *evidence*
23 (e.g., mechanistic understanding, theory, data, models, expert judgment) and on the degree of *agreement*
24 across multiple lines of evidence. In this report, confidence is expressed qualitatively (Mastrandrea et al.,
25 2010).

26
27 **Constant composition commitment** See *Climate change commitment*.

28
29 **Constant emissions commitment** See *Climate change commitment*.

30
31 **Convection** Vertical motion driven by buoyancy forces arising from static instability, usually caused by
32 near-surface cooling or increases in salinity in the case of the ocean and near-surface warming or cloud-top
33 radiative cooling in the case of the *atmosphere*. In the atmosphere, convection gives rise to cumulus clouds
34 and precipitation and is effective at both scavenging and vertically transporting chemical species. In the
35 ocean, convection can carry surface waters to deep within the ocean.

36
37 **Convection-permitting models** See *Cloud-resolving models (CRMs)*.

38
39 **Coral bleaching** Loss of coral pigmentation through the loss of intracellular symbiotic algae (known as
40 zooxanthellae) and/or loss of their pigments.

41
42 **Coral reef** An underwater *ecosystem* characterised by structure-building stony corals. Warm-water coral
43 reefs occur in shallow seas, mostly in the tropics, with the corals (animals) containing algae (plants) that
44 depend on light and relatively stable temperature conditions. Cold-water coral reefs occur throughout the
45 world, mostly at water depths of 50-500 m. In both kinds of reef, living corals frequently grow on older,
46 dead material, predominantly made of calcium carbonate (CaCO₃). Both warm and cold-water coral reefs
47 support high biodiversity of fish and other groups, and are considered to be especially vulnerable to *climate*
48 *change*.

49
50 **Cosmogenic radioisotopes** Rare radioactive *isotopes* that are created by the interaction of a high-energy
51 cosmic ray particles with atoms nuclei. They are often used as indicator of *solar activity* which modulates the
52 cosmic rays intensity or as tracers of atmospheric transport processes, and are also called cosmogenic
53 radionuclides.

54
55 **Coupled Model Intercomparison Project (CMIP)** A *climate* modelling activity from the World Climate

1 Research Programme (WCRP) which coordinates and archives *climate model* simulations based on shared
2 model inputs by modelling groups from around the world. The CMIP3 multi-model data set includes
3 projections using Special Report on Emissions Scenarios (SRES) scenarios. The CMIP5 data set includes
4 projections using the *Representative Concentration Pathways (RCP)*. The CMIP6 phase involves a suite of
5 common model experiments as well as an ensemble of CMIP-endorsed Model Intercomparison Projects
6 (MIPs).

7
8 **Cryosphere** The components of the Earth System at and below the *land* and *ocean* surface that are frozen,
9 including snow cover, *glaciers*, *ice sheets*, *ice shelves*, *icebergs*, *sea ice*, lake ice, river ice, *permafrost* and
10 seasonally *frozen ground*.

11
12 **Cumulative emissions** The total amount of emissions released over a specified period of time. See also
13 *Carbon budget* and *Transient climate response to cumulative CO₂ emissions (TCRE)* (under *Climate*
14 *sensitivity*).

15
16 **Dansgaard-Oeschger events (D-O events)** Millennial-scale events first characterized in Greenland *ice*
17 *cores* as abrupt warming from a cold *stadial* state to a warmer interstadial state, followed by a return to a
18 cold stadial state (Dansgaard et al., 1993), and traced in the ocean via deposits of ice-rafted sand grains
19 (Bond and Lotti, 1995). Named after Willi Dansgaard and Hans Oeschger by Bond and Lotti (1995). An
20 example of a D-O event during the most recent *deglacial* transition is the Bølling-Allerød interstadial. Warm
21 D-O events in Greenland are associated with cooling events in Antarctica (Blunier and Brook, 2001) through
22 ocean *thermohaline circulation* (Stocker and Johnsen, 2003). See also *Bipolar seesaw (also interhemispheric*
23 *seesaw, interhemispheric asymmetry, hemispheric asymmetry)*.

24
25 **Data assimilation** Mathematical method used to combine different sources of information in order to
26 produce the best possible estimate of the state of a system. This information usually consists of observations
27 of the system and a numerical model of the system evolution. Data assimilation techniques are used to create
28 initial conditions for weather forecast models, and to construct *reanalyses* describing the trajectory of the
29 *climate system* over the time period covered by the observations.

30
31 **Dead zones** Extremely *hypoxic* (i.e., low-oxygen) areas in oceans and lakes, caused by excessive nutrient
32 input from human activities coupled with other factors that deplete the oxygen required to support many
33 marine organisms in bottom and near-bottom water.

34
35 **Decadal predictability** Decadal predictability refers to the notion of predictability of the climate system
36 on a decadal time scale. See also *Climate prediction, Predictability* and *Decadal prediction*.

37
38 **Decadal prediction** A decadal prediction is a climate prediction on decadal time scales.

39
40 **Decadal variability** See *Climate variability*.

41
42 **Deep uncertainty** See *Uncertainty*.

43
44 **Deforestation** Conversion of forest to non-forest. [Note: For a discussion of the term forest and related
45 terms such as afforestation, reforestation and deforestation, see the 2006 IPCC Guidelines for National
46 Greenhouse Gas Inventories and their 2019 Refinement, and information provided by the United Nations
47 Framework Convention on Climate Change (IPCC, 2006, 2019, UNFCCC, 2021a, 2021b).]

48
49 See also *Reducing Emissions from Deforestation and Forest Degradation (REDD+), Afforestation* and
50 *Reforestation*.

51
52 **Deglacial or deglaciation or glacial termination** The period of transition from *glacial* conditions at the
53 end of a glacial period to interglacial conditions characterized by a reduction in land ice volume. Gradual
54 changes can be punctuated by *abrupt changes* linked to *stadial / interstadial* events and *bipolar seesaw*
55 aspect. The last deglacial transition occurred between about 18,000 and 11,000 years ago. It encompasses

1 rapid events such as *Meltwater Pulse 1A (MWP-1A)* and millennial-scale fluctuations such as the *Younger*
2 *Dryas*. See also *Glacial-interglacial cycles* and *Ice age*.

3
4 **Detection** Detection of change is defined as the process of demonstrating that climate or a system affected
5 by climate has changed in some defined statistical sense, without providing a reason for that change. An
6 identified change is detected in observations if its likelihood of occurrence by chance due to internal
7 variability alone is determined to be small, for example, <10%.

8
9 **Detection and attribution** See *Detection and Attribution*.

10
11 **Diatoms** Silt-sized algae that live in surface waters of lakes, rivers and oceans and form shells of opal.
12 Their species distribution in ocean cores is often related to past *sea surface temperatures*.

13
14 **Dimensions of integration** In IPCC AR6, concepts used to synthesize the knowledge of *climate change*
15 across not just the physical sciences, but also across *impact* and *adaptation*, and *mitigation* research. The
16 concept of ‘dimensions of integration’ includes (i) emission and *concentration scenarios* underlying the
17 climate change *projections* assessed in this report, (ii) levels of projected global mean temperature change
18 and (iii) total amounts of cumulative carbon emissions for projections.

19
20 **Direct (aerosol) effect** See *Aerosol-radiation interaction*.

21
22 **Direct air capture (DAC)** Chemical process by which a pure carbon dioxide (CO₂) stream is produced by
23 capturing CO₂ from the ambient air. See also *Direct air carbon dioxide capture and storage (DACCS)*,
24 *Anthropogenic removals* and *Carbon dioxide removal (CDR)*.

25
26 **Direct emissions** Emissions that physically arise from activities within well-defined boundaries of, for
27 instance, a region, an economic sector, a company, or a process. See also *Indirect emissions*.

28
29 **Disaster** A ‘serious disruption of the functioning of a community or a society at any scale due to hazardous
30 events interacting with conditions of exposure, vulnerability and capacity, leading to one or more of the
31 following: human, material, economic and environmental losses and impacts’ (UNGA, 2016). See also
32 *Exposure, Hazard, Risk* and *Vulnerability*.

33
34 **Discharge (of ice)** See *Mass balance / budget (of glaciers or ice sheets)*.

35
36 **Dissolved inorganic carbon** The combined total of different types of non-organic carbon in (seawater)
37 solution, comprising carbonate (CO₃²⁻), bicarbonate (HCO₃⁻), carbonic acid (H₂CO₃) and *carbon dioxide*
38 (*CO₂*).

39
40 **Diurnal temperature range (DTR)** The difference between the maximum and minimum temperature
41 during a 24-hour period.

42
43 **Dobson unit (DU)** A unit to measure the total amount of *ozone* in a vertical column above the Earth's
44 surface (total column ozone). The number of Dobson Units is the thickness in units of 10⁻⁵ m that the *ozone*
45 column would occupy if compressed into a layer of uniform density at a pressure of 1013 hPa and a
46 temperature of 0°C. One DU corresponds to a column of ozone containing 2.69 × 10²⁰ molecules per square
47 metre. A typical value for the amount of ozone in a column of the Earth's *atmosphere*, although very
48 variable, is 300 DU.

49
50 **Downscaling** A method that derives local- to regional-scale information from larger-scale models or data
51 analyses. Two main methods exist: dynamical downscaling and empirical/statistical downscaling. The
52 dynamical method uses the output of regional climate models, global models with variable spatial resolution,
53 or high-resolution global models. The empirical/statistical methods are based on observations and develop
54 statistical relationships that link the large-scale atmospheric variables with local/regional climate variables.
55 In all cases, the quality of the driving model remains an important limitation on quality of the downscaled

1 information. The two methods can be combined, e.g., applying empirical/statistical downscaling to the
2 output of a regional climate model, consisting of a dynamical downscaling of a global climate model.
3

4 **Drought** An exceptional period of water shortage for existing *ecosystems* and the human population (due
5 to low rainfall, high temperature, and/or wind). See also *Plant evaporative stress*.
6

7 *Agricultural or ecological drought* Agricultural or ecological drought (depending on the affected *biome*): a
8 period with abnormal *soil moisture* deficit, which results from combined shortage of precipitation and excess
9 *evapotranspiration*, and during the growing season impinges on crop production or *ecosystem* function in
10 general.
11

12 *Hydrological drought* A period with large *runoff* and water deficits in rivers, lakes and reservoirs.
13

14 *Meteorological drought* A period with an abnormal precipitation deficit.
15

16 **Dynamic global vegetation model (DGVM)** A model that simulates vegetation development and
17 dynamics through space and time, as driven by climate and other environmental changes.
18

19 **Dynamical downscaling** See *Downscaling*.
20

21 **Dynamical system** A process or set of processes whose evolution in time is governed by a set of
22 deterministic physical laws. The *climate system* is a dynamical system.
23

24 **Early Eocene Climatic Optimum (EECO)** The EECO is a period of geological time that occurred about
25 53 to 49 million years ago, during the Eocene Epoch. Continental positions at this time were somewhat
26 different to present due to tectonic plate movements. Geological data indicate that the EECO was a period of
27 relatively high atmospheric CO₂ concentrations (about 1150-2500 ppmv) and relative warmth (*global mean*
28 *surface temperature* was about 10-18 °C above the 1850-1900 reference), and polar *ice sheets* were absent.
29

30 **Earth system model (ESM)** A coupled *atmosphere*–ocean general circulation model (AOGCM) in which
31 a representation of the *carbon cycle* is included, allowing for interactive calculation of atmospheric *carbon*
32 *dioxide* (CO₂) or compatible emissions. Additional components (e.g., atmospheric chemistry, *ice sheets*,
33 dynamic vegetation, nitrogen cycle, but also urban or crop models) may be included. See also *Earth system*
34 *model of intermediate complexity* (EMIC).
35

36 **Earth system model of intermediate complexity (EMIC)** Earth system models of intermediate
37 complexity (EMIC) represent *climate* processes at a lower *resolution* or in a simpler, more idealised fashion
38 than an *Earth system model* (ESM).
39

40 **Earth's energy budget** For a given time period, Earth's energy budget expresses the balance between *total*
41 *earth system heating*, the time-integrated *effective radiative forcing* and time-integrated *Earth's radiative*
42 *response*. Units: Joules. See also *Earth's top of atmosphere energy budget*, *Earth's energy imbalance*, *Earth's*
43 *surface energy budget*, *Earth's radiative response*, *Earth's energy flows* and *Earth system heating*.
44

45 **Earth's energy flows** The time-mean (or representative) energy exchanges within the *climate system*
46 (including energy exchanges at the surface and top-of-atmosphere). This also includes horizontal
47 ocean and atmospheric heat transports. See also *Earth's energy budget*, *Earth's top of atmosphere energy*
48 *budget*, *Earth's energy imbalance*, *Earth's surface energy budget*, *Earth system heating* and *Earth's radiative*
49 *response*.
50

51 **Earth's energy imbalance** The persistent and positive (downward) net top of atmosphere energy flux
52 associated with greenhouse gas *forcing* of the *climate system*. See also *Earth's energy budget*, *Earth's top of*
53 *atmosphere energy budget*, *Earth's surface energy budget*, *Earth system heating*, *Earth's radiative response*
54 and *Earth's energy flows*.
55

1 **Earth's radiative response** The product of *global mean surface air temperature (GSAT)* change and the
2 net feedback parameter (i.e. sum of all feedbacks), which determines the net top-of-atmosphere radiative flux
3 that opposes a change in *radiative forcing*. Units: W m^{-2} . See also *Earth's energy budget*, *Earth's top of*
4 *atmosphere energy budget*, *Earth's energy imbalance*, *Earth's surface energy budget*, *Earth system heating*
5 and *Earth's energy flows*.

6
7 **Earth's surface energy budget** Earth's surface energy budget comprises the exchanges of heat at the
8 surface of the Earth associated with both radiative and non-radiative processes. See also *Earth's energy*
9 *budget*, *Earth's top of atmosphere energy budget*, *Earth's energy imbalance*, *Earth system heating*, *Earth's*
10 *radiative response* and *Earth's energy flows*.

11
12 **Earth system sensitivity** See *Climate sensitivity*.

13
14 **Earth's top of atmosphere energy budget** Earth's top of atmosphere energy budget comprises the energy
15 fluxes associated with incoming solar radiation, reflected solar radiation and emitted thermal radiation. See
16 also *Earth's energy budget*, *Earth's energy imbalance*, *Earth's surface energy budget*, *Earth system heating*,
17 *Earth's radiative response* and *Earth's energy flows*.

18
19 **East Antarctic ice sheet (EAIS)** See *Ice sheet*.

20
21 **East Asian monsoon (EAsiaM)** See *Global monsoon*.

22
23 **Eastern boundary upwelling systems (EBUS)** Eastern boundary upwelling system (EBUS) are located at
24 the eastern (landward) edges of major ocean basins in both hemispheres, where equatorward winds drive
25 upwelling currents that bring cool, nutrient-rich (and often oxygen-poor) waters from the deep ocean to the
26 surface near the coast.

27
28 **Eastern Pacific El Niño** See *El Niño-Southern Oscillation (ENSO)*.

29
30 **Economic potential** See *Mitigation potential*.

31
32 **Ecosystem** A functional unit consisting of living organisms, their non-living environment and the
33 interactions within and between them. The components included in a given ecosystem and its spatial
34 boundaries depend on the purpose for which the ecosystem is defined: in some cases they are relatively
35 sharp, while in others they are diffuse. Ecosystem boundaries can change over time. Ecosystems are nested
36 within other ecosystems and their scale can range from very small to the entire biosphere. In the current era,
37 most ecosystems either contain people as key organisms, or are influenced by the effects of human activities
38 in their environment. See also *Ecosystem services*.

39
40 **Effective radiative forcing (ERF)** See *Radiative forcing*, *Aerosol effective radiative forcing (ERF_{ari+aci})*
41 (under *Aerosol-radiation interaction*), *Effective radiative forcing (or effect) due to aerosol-cloud interactions*
42 (*ERF_{aci}*) (under *Aerosol-cloud interaction*) and *Effective radiative forcing (or effect) due to aerosol-*
43 *radiation interactions (ERF_{ari})* (under *Aerosol-radiation interaction*).

44
45 **Ekman transport** The total transport resulting from a balance between the Coriolis force and the frictional
46 stress due to the action of the wind on the ocean surface.

47
48 **El Niño** See *El Niño-Southern Oscillation (ENSO)*.

49
50 **El Niño-Southern Oscillation (ENSO)** The term El Niño was initially used to describe a warm-water
51 current that periodically flows along the coast of Ecuador and Peru, disrupting the local fishery. It has since
52 become identified with warming of the tropical Pacific Ocean east of the dateline. This oceanic event is
53 associated with a fluctuation of a global-scale tropical and subtropical surface pressure pattern called the
54 Southern Oscillation. This coupled atmosphere-ocean phenomenon, with preferred time scales of two to
55 about seven years, is known as the El Niño-Southern Oscillation (ENSO). The warm and cold phases of

1 ENSO are called El Niño and La Niña, respectively. ENSO is often measured by the surface pressure
2 anomaly difference between Tahiti and Darwin and/or the sea surface temperatures in the central and eastern
3 equatorial Pacific. This phenomenon has a great impact on the wind, sea surface temperature and
4 precipitation patterns in the tropical Pacific. It has climatic effects throughout the Pacific region and in many
5 other parts of the world through global *teleconnections*. See Section AIV.2.3 in Annex IV of the AR6 WGI
6 report.

7
8 *Central Pacific El Niño* An El Niño event in which *sea surface temperature* anomalies are stronger in the
9 central equatorial Pacific than in the east. Also known as a Modoki El Niño event.

10
11 *Eastern Pacific El Niño* An El Niño event in which *sea surface temperature* anomalies are largest in the
12 eastern tropical Pacific.

13
14 **Electromagnetic spectrum** Wavelength, frequency or energy range of all electromagnetic radiation. In
15 terms of *solar radiation*, the spectral irradiance is the power arriving at the Earth per unit area, per unit
16 wavelength.

17
18 **Elevation-dependent warming (EDW)** Characteristic of many regions where mountains are located, in
19 which past and/or future surface air temperature changes vary neither uniformly nor linearly with elevation.
20 In many cases, warming is enhanced within or above a certain elevation range.

21
22 **Emergence (of the climate signal)** Emergence of a *climate change* signal or trend refers to when a change
23 in *climate* (the ‘signal’) becomes larger than the amplitude of natural or internal variations (defining the
24 ‘noise’), This concept is often expressed as a ‘signal-to-noise’ ratio and emergence occurs at a defined
25 threshold of this ratio (e.g., S/N > 1 or 2). Emergence can refer to changes relative to a historical or modern
26 baseline (usually at least 20 years long) and can also be expressed in terms of time (*time of emergence*) or in
27 terms of a global warming level. Emergence is also used to refer to a time when we can expect to see a
28 response of reducing *greenhouse gas (GHG)* emissions (emergence with respect to *mitigation*). Emergence
29 can be estimated using observations and/or model simulations. See also *Time of emergence (ToE)*.

30
31 **Emergent constraint** An attempt to reduce the uncertainty in climate projections, using an ensemble of
32 ESMs to relate a specific feedback or future change to an observation of the past or current climate (typically
33 some trend, variability or change in variability).

34
35 **Emission factor/Emissions intensity** A coefficient that quantifies the emissions or removals of a gas per
36 unit activity. Emission factors are often based on a sample of measurement data, averaged to develop a
37 representative rate of emission for a given activity level under a given set of operating conditions.

38
39 **Emissions** See *Indirect emissions, Negative CO₂ emissions, Production-based emissions, Scope 1, Scope 2,*
40 *and Scope 3 emissions, Territorial emissions, Agricultural emissions, Cumulative emissions, Direct*
41 *emissions, Embodied (embedded) [emissions, water, land], Anthropogenic emissions, Fossil fuel emissions,*
42 *Non-CO₂ emissions and radiative forcing and Negative greenhouse gas emissions.* See also *Emissions*
43 *scenario* (under *Scenario*), *Emission pathways* and *Emission trajectories*.

44
45 **Emulation** Reproducing the behaviour of complex, process-based models (namely, *Earth System Models,*
46 *ESMs*) via simpler approaches, using either *emulators* or *simple climate models (SCMs)*. The computational
47 efficiency of emulating approaches opens new analytical possibilities given that ESMs take a lot of
48 computational resources for each simulation. See also *Emulators* and *Simple climate model (SCM)*.

49
50 **Emulators** A broad class of heavily parametrized models (‘one-or-few-line climate models’), statistical
51 methods like neural networks, genetic algorithms or other artificial intelligence approaches, designed to
52 reproduce the responses of more complex, process-based Earth System Models (ESMs). The main
53 application of emulators is to extrapolate insights from ESMs and observational constraints to a larger set of
54 emission scenarios. See also *Emulation* and *Simple climate model (SCM)*.

1 **Energy balance** The difference between the total incoming and total outgoing energy. If this balance is
2 positive, warming occurs; if it is negative, cooling occurs. Averaged over the globe and over long time
3 periods, this balance must be zero. Because the *climate system* derives virtually all its energy from the Sun,
4 zero balance implies that, globally, the absorbed *solar radiation*, that is, *incoming solar radiation* minus
5 reflected *solar radiation* at the top of the *atmosphere* and *outgoing longwave radiation* emitted by the
6 *climate system* are equal.

7
8 **Energy balance model (EBM)** An energy balance model is a simplified model that analyses the energy
9 budget of the Earth to compute changes in the *climate*. In its simplest form, there is no explicit spatial
10 dimension and the model then provides an estimate of the changes in globally averaged temperature
11 computed from the changes in radiation. This zero-dimensional energy balance model can be extended to a
12 one-dimensional or two-dimensional model if changes to the energy budget with respect to latitude, or both
13 latitude and longitude, are explicitly considered.

14
15 **Energy budget (of the Earth)** The Earth is a physical system with an energy budget that includes all gains
16 of incoming energy and all losses of outgoing energy. The Earth's energy budget is determined by measuring
17 how much energy comes into the Earth System from the Sun, how much energy is lost to space, and
18 accounting for the remainder on Earth and its *atmosphere*. *Solar radiation* is the dominant source of energy
19 into the Earth System. Incoming solar energy may be scattered and reflected by clouds and *aerosols* or
20 absorbed in the atmosphere. The transmitted radiation is then either absorbed or reflected at the Earth's
21 surface. The average *albedo* of the Earth is about 0.3, which means that 30% of the incident solar energy is
22 reflected into space, while 70% is absorbed by the Earth. Radiant solar or shortwave energy is transformed
23 into sensible heat, latent energy (involving different water states), potential energy, and kinetic energy before
24 being emitted as *infrared radiation*. With the average *surface temperature* of the Earth of about 15°C (288
25 K), the main outgoing energy flux is in the infrared part of the spectrum.

26
27 **Enhanced weathering** A proposed method to increase the natural rate of removal of *carbon dioxide* (CO_2)
28 from the *atmosphere* using silicate and carbonate rocks. The active surface area of these minerals is
29 increased by grinding, before they are actively added to soil, beaches or the open ocean. See also *Carbon*
30 *dioxide removal (CDR)* and *Anthropogenic removals*.

31
32 **Ensemble** A collection of comparable datasets that reflect variations within the bounds of one or more
33 sources of *uncertainty*, and that when averaged can provide a more robust estimate of underlying behaviour.
34 Ensemble techniques are used by the observational, *reanalysis* and modelling communities. See also *Climate*
35 *simulation ensemble*.

36
37 **Equilibrium and transient climate experiment** An equilibrium climate experiment is a *climate model*
38 experiment in which the model is allowed to fully adjust to a change in *radiative forcing*. Such experiments
39 provide information on the difference between the initial and final states of the model, but not on the time-
40 dependent response. If the forcing is allowed to evolve gradually according to a prescribed *emission*
41 *scenario*, the time-dependent response of a climate model may be analysed. Such an experiment is called a
42 transient climate experiment.

43
44 **Equilibrium climate sensitivity (ECS)** See *Climate sensitivity*.

45
46 **Equilibrium line** The spatially averaged boundary at a given moment, usually chosen as the seasonal *mass*
47 *budget* minimum at the end of summer, between the region on a *glacier* where there is a net annual loss of
48 ice mass (ablation area) and that where there is a net annual gain (*accumulation* area). The altitude of this
49 boundary is referred to as *equilibrium line* altitude (ELA).

50
51 **Equivalent carbon dioxide (CO_2) emission** See *CO_2 equivalent (CO_2 -eq) emission*.

52
53 **Eutrophication** Over-enrichment of water by nutrients such as nitrogen and phosphorus. It is one of the
54 leading causes of water quality impairment. The two most acute symptoms of eutrophication are *hypoxia* (or
55 oxygen depletion) and harmful algal blooms.

1
2 **Evaporation** The physical process by which a liquid (e.g., water) becomes a gas (e.g., water vapour).

3
4 **Evapotranspiration** The combined processes through which water is transferred to the *atmosphere* from
5 open water and ice surfaces, bare soil, and vegetation that make up the Earth's surface.

6
7 *Potential evapotranspiration* The potential rate of water loss from wet soils and from plant surfaces,
8 without any limits imposed by the water supply.

9
10 **Evidence** Data and information used in the scientific process to establish findings. In this report, the
11 degree of evidence reflects the amount, quality and consistency of scientific/technical information on which
12 the Lead Authors are basing their findings. See also *Agreement, Confidence, Likelihood* and *Uncertainty*.

13
14 **Exposure** The presence of people; *livelihoods*; species or *ecosystems*; environmental functions, services,
15 and resources; infrastructure; or economic, social, or cultural assets in places and settings that could be
16 adversely affected.

17
18 **Extended concentration pathways (ECPs)** See *Representative concentration pathways (RCPs)* (under
19 *Pathways*).

20
21 **External forcing** External forcing refers to a *forcing* agent outside the *climate system* causing a change in
22 the climate system. Volcanic eruptions, solar variations and changes in Earth's orbit, as well as
23 *anthropogenic* changes in the composition of the *atmosphere* or in *land use* are external forcings. See also
24 *Orbital forcing*.

25
26 **Extratropical cyclone (ETC)** Any cyclonic-scale storm that is not a *tropical cyclone*. Usually refers to a
27 middle- or high-latitude migratory storm system formed in regions of large horizontal temperature variations.
28 Sometimes called extratropical storm or extratropical low.

29
30 **Extratropical jets** Extratropical jets are wind maxima in the upper *troposphere* marking zones of
31 baroclinic instability. Anomalies in the position of these jets are often associated with storms, *blocking*, and
32 weather extremes.

33
34 **Extreme climate event** See *Climate extreme (extreme weather or climate event)*.

35
36 **Extreme coastal water level (ECWL)** See *Extreme sea level (ESL)*.

37
38 **Extreme sea level (ESL)** The occurrence of an exceptionally low or high local sea-surface height, arising
39 from (a combination of) short term phenomena (e.g. *storm surges*, tides and waves). *Relative sea-level*
40 *changes* affect extreme sea levels directly by shifting the mean water levels and indirectly by modulating the
41 propagation of tides, waves and/or surges due to increased water depth. In addition, extreme sea levels can
42 be influenced by changes in the frequency, tracks, or strength of weather systems and storms, or due to
43 anthropogenically induced changes such as the modification of coastlines or dredging. In turn, changes in
44 any or all of the contributions to extreme sea levels may lead to long term relative sea-level changes.
45 Alternate expressions for ESL may be used depending on the processes resolved.

46
47 Extreme Still Water Level (ESWL) refers to the combined contribution of relative sea-level change, tides
48 and storm-surges. Wind-waves also contribute to coastal sea level via three processes: infragravity waves
49 (lower frequency gravity waves generated by the wind waves); wave setup (time-mean sea-level elevation
50 due to wave energy dissipation); and swash (vertical displacement up the shore-face induced by individual
51 waves). Extreme Total Water Level (ETWL) is the ESWL plus wave setup. When considering coastal
52 impacts, swash is also important, and Extreme Coastal Water Level (ECWL) is used. See also *Storm surge*
53 and *Sea level change (sea level rise/sea level fall)*.

54
55 **Extreme still water level (ESWL)** See *Extreme sea level (ESL)*.

1
2 **Extreme total water level (ETWL)** See *Extreme sea level (ESL)*.

3
4 **Extreme weather event** An event that is rare at a particular place and time of year. Definitions of ‘rare’
5 vary, but an extreme weather event would normally be as rare as or rarer than the 10th or 90th percentile of a
6 probability density function estimated from observations. By definition, the characteristics of what is called
7 extreme weather may vary from place to place in an absolute sense. See also *Heatwave* and *Climate extreme*
8 (*extreme weather or climate event*).

9
10 **Extreme/heavy precipitation event** An extreme/heavy precipitation event is an event that is of very high
11 magnitude with a very rare occurrence at a particular place. Types of extreme precipitation may vary
12 depending on its duration, hourly, daily or multi-days (e.g., 5 days), though all of them qualitatively
13 represent high magnitude. The intensity of such events may be defined with block maxima approach such as
14 annual maxima or with peak over threshold approach, such as rainfall above 95th or 99th percentile at a
15 particular space.

16
17 **Faculae** Bright patches on the Sun. The area covered by faculae is greater during periods of high *solar*
18 *activity*.

19
20 **Feedback** See *Climate feedback*.

21
22 **Fine-mode aerosol optical depth** See *Aerosol optical depth (AOD)*.

23
24 **Fingerprint** The *climate* response pattern in space and/or time to a specific *forcing* is commonly referred
25 to as a fingerprint. The spatial patterns of sea level response to melting of *glaciers* or *ice sheets* (or other
26 changes in surface loading) are also referred to as fingerprints. Fingerprints are used to detect the presence of
27 this response in observations and are typically estimated using forced *climate model* simulations. See also
28 *Detection and attribution*.

29
30 **Fire weather** Weather conditions conducive to triggering and sustaining wildfires, usually based on a set
31 of indicators and combinations of indicators including temperature, soil moisture, humidity, and wind. Fire
32 weather does not include the presence or absence of fuel load.

33
34 **Firn** Snow that has survived at least one *ablation* season but has not been transformed to *glacier* ice. Its
35 pore space is at least partially interconnected, allowing air and water to circulate. Firn densities typically are
36 400–830 kg m⁻³.

37
38 **Fitness-for-purpose** The suitability of a model (or other resource, such as a dataset or method) for a
39 particular task, such as quantifying the contribution of increased *greenhouse gas* concentrations to recent
40 changes in *global mean surface temperature* or projecting changes in *drought* frequency in a region under a
41 given *scenario*. Assessment of a model’s fitness-for-purpose can be informed both by how the model
42 represents relevant physical processes and by how it scores on relevant performance metrics.

43
44 **Flaring** Open air burning of waste gases and volatile liquids, through a chimney, at oil wells or rigs, in
45 refineries or chemical plants, and at landfills.

46
47 **Flood** The overflowing of the normal confines of a stream or other water body, or the accumulation of
48 water over areas that are not normally submerged. Floods can be caused by unusually heavy rain, for
49 example during storms and cyclones. Floods include river (fluvial) floods, flash floods, urban floods, rain
50 (pluvial) floods, sewer floods, *coastal* floods, and *glacial lake outburst floods (GLOFs)*.

51
52 **Flux** A movement (a flow) of matter (e.g., water vapor, particles), heat or energy from one place to
53 another, or from one medium (e.g., land surface) to another (e.g., atmosphere).

54
55 **Foraminifera** Single-celled, sand-sized marine organisms (protists) that possess a hard test mainly

1 composed of agglutinated walls (detrital grains glued together with organic cement) or calcium carbonate
2 (predominantly calcite). They are used to reconstruct a range of (paleo)environmental variables such as
3 salinity, temperature, oxygenation, oxygen isotope composition, and organic and nutrient flux.
4

5 **Forcing** See *Radiative forcing*.
6

7 **Forest** A vegetation type dominated by trees. Many definitions of the term forest are in use throughout the
8 world, reflecting wide differences in biogeophysical conditions, social structure and economics. [Note: For a
9 discussion of the term forest in the context of National GHG inventories, see the 2006 IPCC Guidelines for
10 National GHG Inventories and their 2019 Refinement, and information provided by the United Nations
11 Framework Convention on Climate Change (IPCC, 2006, 2019, UNFCCC, 2021a, 2021b).] See also
12 *Afforestation, Deforestation and Reforestation*.
13

14 **Fossil fuel emissions** Emissions of *greenhouse gases* (in particular *carbon dioxide*), other trace gases and
15 *aerosols* resulting from the combustion of fuels from fossil carbon deposits such as oil, gas and coal.
16

17 **Fossil fuels** Carbon-based fuels from fossil hydrocarbon deposits, including coal, oil, and natural gas.
18

19 **Free atmosphere** The atmospheric layer that is negligibly affected by friction against the Earth's surface,
20 and which is above the *atmospheric boundary layer*.
21

22 **Frozen ground** Soil or rock in which part or all of the pore water consists of ice. See also *Active layer* and
23 *Permafrost*.
24

25 **General circulation** The large-scale motions of the *atmosphere* and the ocean as a consequence of
26 differential heating on a rotating Earth. General circulation contributes to the *energy balance* of the system
27 through transport of heat and momentum.
28

29 **General circulation model (GCM)** A numerical representation of the atmosphere-ocean-sea ice system
30 based on the physical, chemical and biological properties of its components, their interactions and feedback
31 processes. General circulation models are used for weather forecasts, seasonal to decadal prediction, and
32 *climate projections*. They are the basis of the more complex *Earth system models (ESMs)*. See also *Climate*
33 *model*.
34

35 **Geocentric sea-level change** See *Sea level change (sea level rise/sea level fall)*.
36

37 **Geoid** The equipotential surface having the same geopotential at each latitude and longitude around the
38 world (geodesists denoting this potential W_0) that best approximates the *mean sea level*. It is the surface of
39 reference for measurement of altitude. In practice, several variations of definitions of the *geoid* exist
40 depending on the way the permanent tide (the zero-frequency gravitational tide due to the Sun and Moon) is
41 considered in geodetic studies.
42

43 **Geostrophic winds or currents** A wind or current that is in balance with the horizontal pressure gradient
44 and the Coriolis force, and thus is outside of the influence of friction. Thus, the wind or current is directly
45 parallel to isobars and its speed is proportional to the horizontal pressure gradient.
46

47 **Glacial isostatic adjustment (GIA)** The ongoing changes in *gravity, rotation and viscoelastic solid Earth*
48 *deformation (GRD)* in response to past changes in the distribution of ice and water on Earth's surface. On a
49 timescale of decades to tens of millennia following mass redistribution, Earth's mantle flows viscously as it
50 evolves toward isostatic equilibrium, causing solid Earth movement and *geoid* changes, which can result in
51 regional to local sea-level variations. See also *Sea level change (sea level rise/sea level fall)*.
52

53 **Glacial lake outburst flood (GLOF) / Glacier lake outburst** A sudden release of water from a glacier
54 lake, including any of the following types – a glacier-dammed lake, a pro-glacial moraine-dammed lake or
55 water that was stored within, under or on the glacier.

1
2 **Glacial or glaciation** A period characterized by the establishment of expanded ice sheets and glaciers, and
3 associated with global mean sea level (GMSL) substantially lower than present. Generally coincides with
4 even-numbered *marine isotope stages*. Glacial intervals were interrupted by interglacial intervals. The Last
5 Glacial Maximum (LGM) is a specific interval within the most recent glaciation, when ice sheets were near
6 their global maximum volume (Clark et al., 2009; Gowan et al., 2021) and GMSL was near its most recent
7 lowest stand (Lambeck et al., 2014; Yokoyama et al., 2018). Local or regional glacial maxima may be
8 diachronous, for example ranging from about 29,000 years ago and 16,000 years ago. For purposes of global
9 synthesis, IPCC AR6 adopts a practical chronostratigraphic definition of LGM of 23,000-19,000 years BP
10 (before 1950; chronozone level 1 of Mix et al., 2001). For modeling purposes, LGM is defined by the model
11 time step nearest to the center of this interval, 21,000 years ago (Kageyama et al., 2017). See also *Deglacial*
12 *or deglaciation or glacial termination, Glacial-interglacial cycles, Ice age and Interglacial or*
13 *interglaciation.*

14
15 **Glacial termination** See *Deglacial or deglaciation or glacial termination.*

16
17 **Glacial-interglacial cycles** Phase of the Earth's history marked by large changes in continental ice volume
18 and global sea level. See also *Glacial or glaciation, Deglacial or deglaciation or glacial termination,*
19 *Interglacial or interglaciation and Ice age.*

20
21 **Glaciated** State of a surface that was covered by *glacier* ice in the past, but not at present. See also
22 *Glacierised.*

23
24 **Glacier** A perennial mass of ice, and possibly firn and snow, originating on the land surface by
25 accumulation and compaction of snow and showing evidence of past or present flow. A glacier typically
26 gains mass by accumulation of snow, and loses mass by ablation. Land ice masses of continental size
27 (>50,000 km²) are referred to as ice sheets (Cogley et al., 2011).

28
29 *Outlet glacier* A *glacier*, usually between rock walls, that is part of, and drains an *ice sheet*. See also *Ice*
30 *stream.*

31
32 **Glacierised** A surface that is currently covered by *glacier* ice. See also *Glaciated.*

33
34 **Global carbon budget** See *Carbon budget.*

35
36 **Global dimming** Global dimming refers to the observed widespread reduction in the amount of *solar*
37 *radiation* received at the Earth's surface from the 1950s to the 1980s, with an increase in anthropogenic
38 aerosol emissions appearing to have contributed. This was followed by a partial recovery since the 1990s
39 (“brightening”), particularly in industrialized areas, coincident with a reduction in anthropogenic aerosol
40 emissions.

41
42 **Global mean sea-level (GMSL) change** See *Sea level change (sea level rise/sea level fall).*

43
44 **Global mean surface air temperature (GSAT)** Global average of near-surface air temperatures over
45 land, oceans and sea ice. Changes in GSAT are often used as a measure of global temperature change in
46 *climate models*. See also *Global mean surface temperature (GMST).*

47
48 **Global mean surface temperature (GMST)** Estimated global average of near-surface air temperatures
49 over land and sea ice, and *sea surface temperature (SST)* over ice-free ocean regions, with changes normally
50 expressed as departures from a value over a specified *reference period*. See also *Global mean surface air*
51 *temperature (GSAT).*

52
53 **Global monsoon** The global monsoon (GM) is a global-scale solstitial mode that dominates the annual
54 variation of tropical and sub-tropical precipitation and circulation. The GM domain is defined as the area
55 where the annual range of precipitation (local summer minus winter mean precipitation rate) is greater than

1 2.5 mm/day, following on from the definition as in Kitoh et al. (2013). Further details on how the GM is
2 defined, used and related to regional monsoons throughout the report is provided by Annex V.

3
4 *Australian and Maritime Continent monsoon (AusMCM)* The Australian-Maritime Continent monsoon
5 (AusMCM) occurs during December-January-February, with the large-scale shift of the Inter-Tropical
6 Convergence Zone into the Southern Hemisphere and covering northern Australia and the Maritime
7 Continent up to 10N. The AusMCM is characterized by the seasonal reversal of prevailing easterly winds to
8 westerly winds and the onset of periods of active convection and heavy rainfall. Over northern Australia, the
9 monsoon season generally lasts from December to March and is associated with west to northwesterly inflow
10 of moist winds, producing convection and heavy precipitation. Over the Maritime Continent, the main rainy
11 season south of the equator is centered on December to February with northwesterly monsoon flow at low
12 levels. Further details on how AusMCM is defined and used throughout the report is provided in the Annex
13 V.

14
15 *East Asian monsoon (EAsiaM)* The East Asian monsoon (EAsiaM) is the seasonal reversal in wind and
16 precipitation occurring over East Asia, including eastern China, Japan and the Korean peninsula. Differently
17 from the other monsoons it extends quite far north, out of the tropical belt, and it is largely influenced by
18 subtropical systems and by disturbances from the mid-latitudes. The EAsiaM manifests during boreal
19 summer with warm and wet southerly winds, but also during boreal winter with cold and dry northerly
20 winds. In late April/early May rainfall onsets in central Indochina Peninsula, and in mid-June the rainy
21 season arrives over East Asia with the formation of the Meiyu front along the Yangtze River valley,
22 Changma in Korea and Baiu in Japan. Lately in July, the monsoon advances up to North China, the Korean
23 peninsula and central Japan. During boreal winter, strong north-westerlies manifest over north, northeast
24 China, Korea and Japan, while strong north easterlies arrive along the coast of East Asia. Further details on
25 how EAsiaM is defined and used throughout the report is provided in the Annex V.

26
27 *North American monsoon (NAmerM)* The North American monsoon (NAmerM) is a regional-scale
28 atmospheric circulation system with increase in summer precipitation over northwestern Mexico and
29 southwest United States. The monsoonal characteristics of the region include a pronounced annual maximum
30 of precipitation in boreal summer (June-July-August) accompanied by a surface low pressure system and an
31 upper-level anticyclone, although seasonal reversal of the surface winds is primarily limited to the northern
32 Gulf of California. Further details on how NAmerM is defined and used throughout the report is provided in
33 the Annex V.

34
35 *South American monsoon (SAmerM)* The South American monsoon (SAmerM) is a regional circulation
36 characterized by inflow of low-level winds from the Atlantic to South America, including Brazil, Peru',
37 Bolivia and northern Argentina, associated with the development of surface pressure gradients (and intense
38 precipitation) during austral summer (December-January-February). During September-October-November
39 areas of intense convection migrate from northwestern South America to the south. Associated to this
40 regime, an upper-tropospheric anticyclone (a.k.a the Bolivian High) forms over the Altiplano region during
41 the monsoon onset. The SAmerM then retreats during March-April-May with a northeastward migration of
42 the convection. Further details on how SAmerM is defined and used throughout the report is provided in the
43 Annex V.

44
45 *South and Southeast Asian monsoon (SAsiaM)* The South and Southeast Asian monsoon (SAsiaM) is
46 characterized by pronounced seasonal reversals of wind and precipitation. The SAsiaM region extends across
47 vast geographical areas and several countries including India, Bangladesh, Nepal, Myanmar, Sri Lanka,
48 Pakistan, Thailand, Laos, Cambodia, Vietnam and Philippine. The SAsiaM starts in late May/early June and
49 progresses toward northeast, ending in late September/early October. During the core monsoon season,
50 maxima of SAsiaM precipitation are located over the west coast, northeast and central north India, Myanmar
51 and Bangladesh, whereas minima are located over northwest and southeastern India, western Pakistan,
52 southeastern and northern Sri Lanka. Further details on how SAsiaM is defined and used throughout the
53 report is provided in the Annex V.

54
55 *West African monsoon (WAfriM)* The West African monsoon (WAfriM) is a seasonal reversal in wind and

1 precipitation whose domain includes Benin, Burkina-Faso, northern Cameroon, Cape Verde, northern
2 Central African Republic, Chad, Gambia, Ghana, Guinea, Guinea Bissau, Ivory Coast, Liberia, Mali,
3 Mauritania, Niger, Nigeria, Senegal, Sierra Leone and Togo. The WAfriM is characterized by the northward
4 progression from May to September of moist low-level south-westerlies from the Gulf of Guinea. In May
5 and June, rainfall essentially remains along the Guinean coast with a maximum occurring near 5°N, followed
6 by a sudden decrease of rainfall, marking the “short dry season” in the Guinean coast and the monsoon onset
7 in the Sahel. Then rainfall continues to progress northward up to about 18-20°N, with a maximum near 12°N
8 in late August/September, until it retreats starting from October towards the Guinean coast for a second
9 maximum. Further details on how WAfriM is defined and used throughout the report is provided in the
10 Annex V.

11
12 **Global surface temperature** See *Global mean surface temperature (GMST)* and *Global mean surface air*
13 *temperature (GSAT)*. See also *Global warming*.

14
15 **Global warming** Global warming refers to the increase in *global surface temperature* relative to a baseline
16 *reference period*, averaging over a period sufficient to remove interannual variations (e.g., 20 or 30 years). A
17 common choice for the baseline is 1850-1900 (the earliest period of reliable observations with sufficient
18 geographic coverage), with more modern baselines used depending upon the application. See also *Climate*
19 *change* and *Climate variability*.

20
21 **Global warming potential (GWP)** An index measuring the *radiative forcing* following an emission of a
22 unit mass of a given substance, accumulated over a chosen time horizon, relative to that of the reference
23 substance, *carbon dioxide (CO₂)*. The GWP thus represents the combined effect of the differing times these
24 substances remain in the atmosphere and their effectiveness in causing radiative forcing. See also *Lifetime*
25 *and Greenhouse gas emission metric*.

26
27 **Gravitational, rotational and deformational (GRD) effects** See *Sea level change (sea level rise/sea level*
28 *fall)*.

29
30 **Gravity Recovery And Climate Experiment (GRACE)** A pair of satellites to measure the Earth's gravity
31 field anomalies from 2002 to 2017. These fields have been used, among other things, to study mass changes
32 of the polar *ice sheets* and *glaciers*.

33
34 **Greenhouse effect** The infrared radiative effect of all infrared-absorbing constituents in the *atmosphere*.
35 *Greenhouse gases (GHGs)*, clouds, and some *aerosols* absorb *terrestrial radiation* emitted by the Earth's
36 surface and elsewhere in the atmosphere. These substances emit infrared radiation in all directions, but,
37 everything else being equal, the net amount emitted to space is normally less than would have been emitted
38 in the absence of these absorbers because of the decline of temperature with altitude in the *troposphere* and
39 the consequent weakening of emission. An increase in the concentration of GHGs increases the magnitude of
40 this effect; the difference is sometimes called the enhanced greenhouse effect. The change in a GHG
41 concentration because of *anthropogenic* emissions contributes to an *instantaneous radiative forcing*. *Surface*
42 *temperature* and *troposphere* warm in response to this forcing, gradually restoring the radiative balance at
43 the top of the atmosphere.

44
45 **Greenhouse gas emission metric** A simplified relationship used to quantify the effect of emitting a unit
46 mass of a given *greenhouse gas* on a specified key measure of *climate change*. A relative GHG emission
47 metric expresses the effect from one gas relative to the effect of emitting a unit mass of a reference GHG on
48 the same measure of climate change. There are multiple emission metrics and the most appropriate metric
49 depends on the application. GHG emission metrics may differ with respect to (i) the key measure of climate
50 change they consider, (ii) whether they consider climate outcomes for a specified point in time or integrated
51 over a specified time horizon, (iii) the time horizon over which the metric is applied, (iv) whether they apply
52 to a single emission pulse, emissions sustained over a period of time, or a combination of both, and (v)
53 whether they consider the climate effect from an emission compared to the absence of that emission, or
54 compared to a reference emissions level or climate state.

1 Notes: Most relative GHG emission metrics (such as the *Global Warming Potential (GWP)*, Global
2 Temperature change Potential (GTP), Global Damage Potential, and GWP*), use carbon dioxide as the
3 reference gas. Emissions of non-CO₂ gases, when expressed using such metrics, are often referred to as
4 “carbon dioxide equivalent” emissions. A metric that establishes equivalence regarding one key measure of
5 the *climate system* response to emissions does not imply equivalence regarding other key measures. The
6 choice of a metric, including its time horizon, should reflect the policy objectives for which the metric is
7 applied.

8
9 **Greenhouse gas neutrality** Condition in which metric-weighted anthropogenic greenhouse gas (GHG)
10 emissions associated with a subject are balanced by metric-weighted anthropogenic GHG removals. The
11 subject can be an entity such as a country, an organisation, a district or a commodity, or an activity such as a
12 service and an event. GHG neutrality is often assessed over the life cycle including indirect (“scope 3”)
13 emissions, but can also be limited to the emissions and removals, over a specified period, for which the
14 subject has direct control, as determined by the relevant scheme. The quantification of GHG emissions and
15 removals depends on the GHG emission metric chosen to compare emissions and removals of different
16 gases, as well as the time horizon chosen for that metric.

17
18 Note 1: GHG neutrality and net zero GHG emissions are overlapping concepts. The concepts can be applied
19 at global or sub-global scales (e.g., regional, national and sub-national). At a global scale, the terms
20 greenhouse gas neutrality and net zero greenhouse gas emissions are equivalent. At sub-global scales, net
21 zero greenhouse gas emissions is generally applied to emissions and removals under direct control or
22 territorial responsibility of the reporting entity, while greenhouse gas neutrality generally includes emissions
23 and removals within and beyond the direct control or territorial responsibility of the reporting entity.
24 Accounting rules specified by GHG programmes or schemes can have a significant influence on the
25 quantification of relevant emissions and removals.

26
27 Note 2. Under the Paris Rulebook [Decision 18/CMA.1, annex, paragraph 37], parties have agreed to use
28 GWP100 values from the IPCC AR5 or GWP100 values from a subsequent IPCC Assessment Report to
29 report aggregate emissions and removals of GHGs. In addition, parties may use other metrics to report
30 supplemental information on aggregate emissions and removals of GHGs.

31
32 Note 3: In some cases, achieving greenhouse gas neutrality may rely on the supplementary use of *offsets* to
33 balance emissions that remain after actions by the reporting entity are taken into account.] See also *Carbon*
34 *neutrality*, *Greenhouse gas emission metric*, *Land use, land-use change and forestry (LULUCF)* and *Net*
35 *zero greenhouse gas emissions*.

36
37 **Greenhouse gases (GHGs)** Gaseous constituents of the *atmosphere*, both natural and *anthropogenic*, that
38 absorb and emit radiation at specific wavelengths within the spectrum of radiation emitted by the Earth's
39 surface, by the atmosphere itself, and by clouds. This property causes the *greenhouse effect*. Water vapour
40 (H₂O), *carbon dioxide (CO₂)*, *nitrous oxide (N₂O)*, *methane (CH₄)* and *ozone (O₃)* are the primary GHGs in
41 the Earth's atmosphere. Human-made GHGs include *sulphur hexafluoride (SF₆)*, *hydrofluorocarbons*
42 *(HFCs)*, *chlorofluorocarbons (CFCs)* and *perfluorocarbons (PFCs)*; several of these are also O₃-depleting
43 (and are regulated under the *Montreal Protocol*). See also *Well-mixed greenhouse gas*.

44
45 **Greenland ice sheet (GrIS)** See *Ice sheet*.

46 **Gross Primary Production (GPP)** See *Primary production*.

47
48 **Ground-level ozone** Atmospheric *ozone (O₃)* formed naturally or from human-emitted precursors near
49 Earth's surface, thus affecting human health, agriculture, and ecosystems. Ozone is a *greenhouse gas (GHG)*,
50 but ground-level ozone, unlike stratospheric ozone, also directly affects organisms at the surface. Ground-
51 level ozone is sometimes referred to as tropospheric ozone, although much of the troposphere is well above
52 the surface and thus does not directly expose organisms at the surface.

53
54 **Grounding line** The junction between a *glacier* or *ice sheet* and an *ice shelf*; the place where ice starts to
55 float. This junction normally occurs over a zone, rather than at a line.

1
2 **Gyre** Basin-scale ocean horizontal circulation pattern with slow flow circulating around the ocean basin,
3 closed by a strong and narrow (100 to 200 km wide) boundary current on the western side. The subtropical
4 gyres in each ocean are associated with high pressure in the centre of the gyres; the subpolar gyres are
5 associated with low pressure.

6
7 **Hadley cell** See *Hadley circulation*.

8
9 **Hadley circulation** A direct, thermally driven overturning cell in the *atmosphere* consisting of poleward
10 flow in the upper *troposphere*, subsiding air into the subtropical anticyclones, return flow as part of the trade
11 winds near the surface, and with rising air near the equator in the so-called *Inter-Tropical Convergence*
12 *Zone*.

13
14 **Halocarbons** A collective term for the group of partially halogenated organic species, which includes the
15 *chlorofluorocarbons (CFCs)*, hydrochlorofluorocarbons (HCFCs), *hydrofluorocarbons (HFCs)*, halons,
16 methyl chloride and methyl bromide. Many of the halocarbons have large *global warming potentials*. The
17 chlorine and bromine-containing halocarbons are also involved in the depletion of the ozone layer.

18
19 **Halocline** A layer in the oceanic water column in which salinity changes rapidly with depth. Generally
20 saltier water is denser and lies below less salty water. In some high latitude oceans the surface waters may be
21 colder than the deep waters and the halocline is responsible for maintaining water column stability and
22 isolating the surface waters from the deep waters.

23
24 **Halosteric** See *Sea level change (sea level rise/sea level fall)*.

25
26 **Halosteric sea-level change** See *Sea level change (sea level rise/sea level fall)*.

27
28 **Hazard** The potential occurrence of a natural or human-induced physical event or trend that may cause
29 loss of life, injury, or other health impacts, as well as damage and loss to property, infrastructure,
30 livelihoods, service provision, ecosystems and environmental resources. See also *Impacts (consequences,*
31 *outcomes)* and *Risk*.

32
33 **Heat index** A measure of how hot the air feels to the human body. The index is mainly based on surface
34 air temperature and relative humidity, thus it reflects the combined effect of high temperature and humidity
35 on human physiology and provides a relative indication of potential health risks.

36
37 **Heat stress** A range of conditions in, e.g., terrestrial or aquatic organisms when the body absorbs excess
38 heat during overexposure to high air or water temperatures or thermal radiation. In aquatic water breathing
39 animals, hypoxia and acidification can exacerbate vulnerability to heat. Heat stress in mammals (including
40 humans) and birds, both in air, is exacerbated by a detrimental combination of ambient heat, high humidity
41 and low wind-speeds, causing regulation of body temperature to fail.

42
43 **Heatwave** A period of abnormally hot weather often defined with reference to a relative temperature
44 threshold, lasting from two days to months. Heatwaves and warm spells have various and, in some cases,
45 overlapping definitions. See also *Marine heatwave, Warm spell, Blocking, Heat index* and *Heat stress*.

46
47 **Heavy precipitation event** See *Extreme/heavy precipitation event*.

48
49 **Heinrich event** Distinct layers of coarse-grained sediments comprised of ice-rafted debris identified across
50 marine sediment cores in the North Atlantic. These sedimentary layers are closely associated with
51 millennial-scale cooling events in the North Atlantic and a distinct pattern of global temperature and
52 hydrological changes that are largely consistent with evidence for a slowdown, or even near-collapse, of the
53 *Atlantic meridional ocean circulation (AMOC)* during these times.

54
55 **Heterotrophic respiration** The conversion of organic matter to *carbon dioxide* by organisms other than

1 autotrophs.

2
3 **Hindcast or retrospective forecast** A forecast made for a period in the past using only information
4 available before the beginning of the forecast. A sequence of hindcasts can be used to calibrate the forecast
5 system and/or provide a measure of the average skill that the forecast system has exhibited in the past as a
6 guide to the skill that might be expected in the future.

7
8 **Holocene** The current *interglacial* geological epoch, the second of two epochs within the Quaternary
9 Period, the preceding being the *Pleistocene*. The International Commission on Stratigraphy (ICS) defines the
10 start of the Holocene Epoch at 11,700 years before 2000 (ICS, 2018). It encompasses the mid-Holocene
11 (MH), the 1000-year-long interval centered at 6000 years before 1950; a period of long-standing focus for
12 climate modelling, with enhanced seasonality in the Northern Hemisphere and decreased seasonality in the
13 Southern Hemisphere. The early part of the Holocene is marked by the late stages of *deglaciation* of
14 Pleistocene land ice, and sea level rise, and the occurrence of warm phases that affected different regions at
15 different times, often referred to as the “Holocene thermal maximum”. In addition, the epoch includes the
16 post-glacial interval, which began approximately 7000 years ago when the fundamental features of the
17 modern *climate system* were essentially in place, as the influence of remnant Pleistocene *ice sheets* waned.
18 See also *Anthropocene*.

19
20 **Holocene Thermal Maximum (HTM)** See *Holocene*.

21
22 **Human influence on the climate system** Human-driven activities that lead to changes in the climate
23 system due to perturbations of the Earth’s energy budget (also called *anthropogenic forcing*). Human
24 influence results from emissions of *greenhouse gases*, *aerosols*, *ozone-depleting substances (ODSs)*, and
25 *land-use change*. See also *Anthropogenic*, *Anthropogenic emissions* and *Anthropogenic removals*.

26
27 **Human system** Any system in which human organisations and institutions play a major role. Often, but
28 not always, the term is synonymous with society or social system. Systems such as agricultural systems,
29 urban systems, political systems, technological systems, and economic systems are all human systems in the
30 sense applied in this report.

31
32 **Hurricane** See *Tropical cyclone*.

33
34 **Hydroclimate** Part of the *climate* pertaining to the hydrology of a *region*.

35
36 **Hydrofluorocarbons (HFCs)** One of the seven types of greenhouse gases (GHGs) or groups of GHGs to
37 be mitigated under the Kyoto Protocol. They are produced commercially as a substitute for
38 chlorofluorocarbons (CFCs). HFCs largely are used in refrigeration and semiconductor manufacturing.

39
40 **Hydrological cycle** The cycle in which water evaporates from the ocean and the land surface, is carried
41 over the Earth in atmospheric circulation as water vapour, condenses to form clouds, precipitates over the
42 ocean and land as rain or snow, which on land can be intercepted by trees and vegetation, potentially
43 accumulating as snow or ice, provides runoff on the land surface, infiltrates into soils, recharges
44 groundwater, discharges into streams, and ultimately, flows into the oceans as rivers, polar glaciers and ice
45 sheets, from which it will eventually evaporate again. The various systems involved in the hydrological cycle
46 are usually referred to as hydrological systems.

47
48 **Hydrological drought** See *Drought*.

49
50 **Hydrological sensitivity (η)** The change in global-mean precipitation per degree Celsius of global mean
51 temperature change when precipitation changes related to fast atmospheric and land surface adjustments to
52 radiative forcings are removed. Units are % per °C although can also be calculated as $W\ m^{-2}$ per °C. See also
53 *Apparent hydrological sensitivity (η_a)*.

54
55 **Hydrosphere** The component of the *climate system* comprising liquid surface and subterranean water,

1 such as in oceans, seas, rivers, freshwater lakes, underground water, *wetlands*, etc.

2
3 **Hypoxic** Conditions of low dissolved oxygen in shallow water ocean and freshwater environments. There
4 is no universal threshold for hypoxia. A value around $60 \mu\text{mol kg}^{-1}$ has commonly been used for some
5 estuarine systems, although this does not necessarily directly translate into biological impacts. Anoxic
6 conditions occur where there is no oxygen present at all. See also *Eutrophication*.

7
8 **Hypsometry** The distribution of land or ice surface as a function of altitude.

9
10 **Ice age** An informal term for a geological period characterised by a long-term reduction in the temperature
11 of the Earth's *climate*, resulting in the presence or expansion of *ice sheets* and *glaciers*. Among the Earth's
12 ice ages is the current Quaternary Period, characterized by alternating *glacial* and *interglacial* intervals. See
13 also *Deglacial or deglaciation or glacial termination* and *Glacial-interglacial cycles*.

14
15 **Ice core** A cylinder of ice drilled out of a *glacier* or *ice sheet* to determine the physical properties of the ice
16 body, and to gain information on past changes in *climate* and composition of the *atmosphere* that are
17 preserved in the ice or in air trapped in the ice.

18
19 **Ice sheet** An ice body originating on land that covers an area of continental size, generally defined as
20 covering $>50,000 \text{ km}^2$, and that has formed over thousands of years through *accumulation* and compaction
21 of snow. An ice sheet flows outward from a high central ice plateau with a small average surface slope. The
22 margins usually slope more steeply, and most ice is *discharged* through fast-flowing ice streams or outlet
23 *glaciers*, often into the sea or into *ice shelves* floating on the sea. There are only two ice sheets in the modern
24 world, one on Greenland and one on Antarctica. The latter is divided into the East Antarctic Ice Sheet
25 (EAIS), the West Antarctic Ice Sheet (WAIS) and the Antarctic Peninsula ice sheet. During glacial periods,
26 there were other ice sheets.

27
28 **Ice shelf** A floating slab of ice originating from *land* of considerable thickness extending from the *coast*
29 (usually of great horizontal extent with a very gently sloping surface), resulting from the flow of *ice sheets*,
30 initially formed by the accumulation of snow, and often filling embayments in the coastline of an ice sheet.
31 Nearly all ice shelves are in Antarctica, where most of the ice *discharged* into the *ocean* flows via ice
32 shelves.

33
34 **Ice stream** A stream of ice with strongly enhanced flow that is part of an *ice sheet*. It is often separated
35 from surrounding ice by strongly sheared, crevassed margins.

36
37 **Ice-albedo feedback** A *climate feedback* involving changes in the Earth's surface *albedo*. Snow and ice
38 have an albedo much higher (up to ~ 0.8) than the average planetary albedo (~ 0.3). With increasing
39 temperatures, it is anticipated that snow and ice extent will decrease, the Earth's overall albedo will decrease
40 and more *solar radiation* will be absorbed, warming the Earth further.

41
42 **Iceberg** Large piece of freshwater ice broken off from a *glacier* or an *ice shelf* during *calving* and floating
43 in open water (at least five metres height above sea level). Smaller pieces of floating ice known as 'bergy
44 bits' (less than 5 metres above sea level) or 'growlers' (less than 2 metres above sea level) can originate from
45 glaciers or ice shelves, or from the breaking up of a large iceberg. Icebergs can also be classified by shape,
46 most commonly being either tabular (steep sides and a flat top) or non-tabular (varying shapes, with domes
47 and spires) (NOAA, 2021). In lakes, icebergs can originate by breaking off shelf ice, which forms through
48 freezing of a lake surface.

49
50 **Impacts (consequences, outcomes)** The consequences of realised risks on natural and human systems,
51 where risks result from the interactions of climate-related hazards (including extreme weather / climate
52 events), exposure, and vulnerability. Impacts generally refer to effects on lives, livelihoods, health and
53 wellbeing, ecosystems and species, economic, social and cultural assets, services (including ecosystem
54 services), and infrastructure. Impacts may be referred to as consequences or outcomes, and can be adverse or
55 beneficial. See also *Adaptation, Exposure, Hazard, Loss and Damage, and losses and damages*,

1 *Vulnerability and Risk.*

2
3 **Incoming solar radiation** See *Insolation.*

4
5 **Indian Ocean Basin (IOB) mode** A mode of interannual variability characterized by a temporal
6 alternation of basin-wide warming and cooling of the Indian Ocean sea surface. It mostly develops in
7 response to *El Niño-Southern Oscillation (ENSO)*, but often persists after ENSO's equatorial eastern Pacific
8 signal has dissipated. The IOB affects atmospheric circulation, temperature, and precipitation in South,
9 Southeast, and East Asia as well as Africa, and modulates *tropical cyclone* activity in the Northwestern
10 Pacific. See Section AIV.2.4 in Annex IV of the AR6 WGI report. See also *Modes of climate variability* and
11 *Indian Ocean Dipole (IOD).*

12
13 **Indian Ocean Dipole (IOD)** A mode of interannual variability that features an east-west dipole of *sea*
14 *surface temperature* anomalies in the tropical Indian Ocean. Its positive phase shows concurrent sea surface
15 cooling off Sumatra and Java and warming off Somalia in the west, combined with anomalous surface
16 easterlies along the equator, while the opposite anomalies are seen in the negative phase. The IOD typically
17 develops in boreal summer and matures in boreal autumn and controls part of the rainfall interannual
18 variability in Australia, South Eastern Asia and Eastern Africa. See Section AIV.2.4 in Annex IV of the AR6
19 WGI report. See also *Indian Ocean Basin (IOB) mode.*

20
21 **Indirect aerosol effect** See *Aerosol-cloud interaction.*

22
23 **Indirect land-use change (iLUC)** See *Land-use change (LUC).*

24
25 **Industrial revolution** A period of rapid industrial growth with far-reaching social and economic
26 consequences, beginning in Britain during the second half of the 18th century and spreading to Europe and
27 later to other countries including the United States. The invention of the steam engine was an important
28 trigger of this development. The industrial revolution marks the beginning of a strong increase in the use of
29 *fossil fuels*, initially coal, and hence emission of *carbon dioxide (CO₂)*.

30
31 **Infrared radiation** See *Terrestrial radiation.*

32
33 **Initial condition ensemble (ICE)** See *Model ensemble.*

34
35 **Insolation** The amount of *solar radiation* reaching the Earth by latitude and by season measured in W m^{-2} .
36 Usually insolation refers to the radiation arriving at the top of the *atmosphere*. Sometimes it is specified as
37 referring to the radiation arriving at the Earth's surface. See also *Orbital forcing* and *Total solar irradiance*
38 *(TSI).*

39
40 **Instantaneous radiative forcing (or effect) due to aerosol-cloud interactions (IRFaci)** See *Aerosol-*
41 *cloud interaction.*

42
43 **Instantaneous radiative forcing (or effect) due to aerosol-radiation interactions (IRFari)** See *Aerosol-*
44 *radiation interaction.*

45
46 **Integrated assessment model (IAM)** Models that integrate knowledge from two or more domains into a
47 single framework. They are one of the main tools for undertaking integrated assessments. One class of IAM
48 used in respect of climate change mitigation may include representations of: multiple sectors of the
49 economy, such as energy, land use and land use change; interactions between sectors; the economy as a
50 whole; associated greenhouse gas (GHG) emissions and sinks; and reduced representations of the climate
51 system. This class of model is used to assess linkages between economic, social and technological
52 development and the evolution of the climate system. Another class of IAM additionally includes
53 representations of the costs associated with climate change impacts, but includes less detailed representations
54 of economic systems. These can be used to assess impacts and mitigation in a cost-benefit framework and
55 have been used to estimate the social cost of carbon.

1
2 **Interdecadal Pacific Oscillation (IPO)** See *Pacific Decadal Variability (PDV)*.

3
4 **Inter-Tropical Convergence Zone (ITCZ)** The Inter-Tropical Convergence Zone is an equatorial zonal
5 belt of low pressure, strong *convection* and heavy precipitation near the equator where the northeast trade
6 winds meet the southeast trade winds. This band moves seasonally. See also *South Pacific Convergence*
7 *Zone (SPCZ)*.

8
9 **Interglacial or interglaciation** A globally warm period lasting thousands of years between *glacial* periods
10 within an *ice age*. Generally coincides with odd-numbered *marine isotope stages (MIS)* when mean sea level
11 was close to present. The Last Interglacial (LIG) occurred between about 129 and 116 ka (thousand years)
12 before present (defined as 1950) although the warm period started in some areas a few thousand years
13 earlier. In terms of marine isotope stages (MIS), *interglaciations* are defined as the interval between the
14 midpoint of the preceding termination and the onset of the next glaciation. The LIG coincides with MIS 5e.
15 The present interglaciation, the *Holocene*, started at 11,700 years before 2000 CE, although global mean sea
16 level did not approach its present position until roughly 7000 years ago. See also *Deglacial or deglaciation*
17 *or glacial termination, Glacial-interglacial cycles, Glacial or glaciation* and *Ice age*.

18
19 **Internal climate variability** See *Internal variability* (under *Climate variability*).

20
21 **Irreversibility** A perturbed state of a *dynamical system* is defined as irreversible on a given timescale, if
22 the recovery from this state due to natural processes takes substantially longer than the timescale of interest.
23 See also *Tipping point*.

24
25 **Isostatic or Isostasy** Isostasy refers to the response of the earth to changes in surface load. It includes the
26 deformational and gravitational response. This response is elastic on short time scales, as in the earth-ocean
27 response to recent changes in mountain glaciation, or viscoelastic on longer time scales, as in the response to
28 the last *deglaciation* following the *Last Glacial Maximum*.

29
30 **Isotopes** Atoms of the same chemical element that have the same the number of protons but differ in the
31 number of neutrons. Some proton-neutron configurations are stable (stable isotopes), others are unstable
32 undergoing spontaneous radioactive decay (radioisotopes). Most elements have more than one stable isotope.
33 Isotopes can be used to trace transport processes or to study processes that change the isotopic ratio.
34 Radioisotopes provide in addition time information that can be used for radiometric dating. See also ^{13}C and
35 ^{14}C .

36
37 **Key climate indicators** See *Climate indicator*.

38
39 **Kriging** Kriging is a method of interpolation (normally spatial interpolation when used with atmospheric
40 or oceanographic data), in which the interpolated values are estimated using a Gaussian process governed by
41 prior covariances.

42
43 **La Niña** See *El Niño-Southern Oscillation (ENSO)*.

44
45 **Land** The terrestrial portion of the biosphere that comprises the natural resources (soil, near-surface air,
46 vegetation and other biota, and water), the ecological processes, topography, and human settlements and
47 infrastructure that operate within that system (UNCCD, 1994; FAO, 2007).

48
49 **Land cover** The biophysical coverage of *land* (e.g., bare soil, rocks, forests, buildings and roads or lakes).
50 Land cover is often categorised in broad land-cover classes (e.g., deciduous forest, coniferous forest, mixed
51 forest, grassland, bare ground). [Note: In some literature, land cover and land use are used interchangeably,
52 but the two represent distinct classification systems. For example, the land cover class woodland can be
53 under various land uses such as livestock grazing, recreation, conservation, or wood harvest.]

54
55 **Land cover change** Change from one *land cover* class to another, due to change in *land use* or change in

1 natural conditions (Pongratz et al., 2018). See also *Land management change* and *Land-use change (LUC)*.

2
3 **Land surface air temperature (LSAT)** The near-surface air temperature over land, typically measured at
4 1.25–2 m above the ground using standard meteorological equipment.

5
6 **Land use** The total of arrangements, activities and inputs applied to a parcel of land. The term land use is
7 also used in the sense of the social and economic purposes for which land is managed (e.g., grazing, timber
8 extraction, conservation and city dwelling). In national GHG inventories, land use is classified according to
9 the IPCC land use categories of forest land, cropland, grassland, wetlands, settlements, other lands (see the
10 2006 IPCC Guidelines for National GHG Inventories and their 2019 Refinement for details (IPCC, 2006,
11 2019)).

12
13 **Land water storage** Land water storage (LWS) includes all surface water, soil moisture, groundwater
14 storage and snow, but excludes water stored in *glaciers* and *ice sheets*. Changes in land water storage can be
15 caused either by direct human intervention in the water cycle (e.g., storage of water in reservoirs by building
16 dams in rivers, groundwater extraction from groundwater reservoirs for consumption and irrigation, or
17 deforestation) or by *climate* variations (e.g., changes in the amount of water in endorheic lakes and wetlands,
18 the canopy, the soil, the permafrost and the snowpack). Land water storage changes caused by climate
19 variations may also be indirectly affected by *anthropogenic* influences. See also *Sea level change (sea level*
20 *rise/sea level fall)*.

21
22 **Land-use change (LUC)** The change from one *land use* category to another. Note that in some scientific
23 literature, land-use change encompasses changes in land-use categories as well as changes in land
24 management. See also *Afforestation, Agriculture, Forestry and Other Land Use (AFOLU), Deforestation,*
25 *Land use, land-use change and forestry (LULUCF)* and *Reforestation*.

26
27 *Indirect land-use change (iLUC)* Land use change outside the area of focus, that occurs as a consequence
28 of change in use or management of land within the area of focus, such as through market or policy drivers.
29 For example, if agricultural land is diverted to biofuel production, forest clearance may occur elsewhere to
30 replace the former agricultural production. See *Land-use change (LUC)*.

31
32 **Lapse rate** The rate of change of an atmospheric variable, usually temperature, with height. The lapse rate
33 is considered positive when the variable decreases with height.

34
35 **Large-scale** The climate system involves process interactions from the micro- to the global-scale. Any
36 threshold for defining “large-scale” is arbitrary. Understanding of large-scale climate variability and change
37 requires knowledge of both the response to external forcings and the role of internal variability. Many
38 external forcings have substantial hemispheric or continental scale variations. Modes of climate variability
39 are driven by ocean basin scale processes. Thus we define large-scale to include ocean basin and continental
40 scales as well as hemispheric and global scales.

41
42 **Last deglacial transition** See *Deglacial or deglaciation or glacial termination* and *Younger Dryas*.

43
44 **Last Glacial Maximum (LGM)** See *Glacial or glaciation*.

45
46 **Last Interglacial (LIG)** See *Interglacial or interglaciation*.

47
48 **Last millennium** The interval of the *Common Era (CE)* between 1001 and 2000 CE. Encompasses the
49 Little Ice Age, a roughly defined period characterized by multiple expansions of mountain *glaciers*
50 worldwide, the timing of which differs among regions, but generally occurred between 1400 CE and 1900
51 CE. The last millennium also mostly encompasses the Medieval Warm Period (also called the Medieval
52 Climate Anomaly), a roughly defined period of relatively warm conditions or other *climate* excursions such
53 as extensive *drought*, the timing and magnitude of which differ among regions, but generally occurred
54 between 900 and 1400 CE. Transient *climate model* experiments by the Paleoclimate Modelling
55 Intercomparison Project (PMIP) for the last millennium extend from 850-1849 CE.

1
2 **Latent heat flux** The turbulent flux of heat from the Earth's surface to the atmosphere that is associated
3 with *evaporation* or condensation of water vapour at the surface; a component of the surface energy budget.
4 See also *Atmosphere* and *Flux*.

5
6 **Lifetime** Lifetime is a general term used for various time scales characterizing the rate of processes
7 affecting the concentration of trace gases. The following lifetimes may be distinguished:

8
9 *Response time or adjustment time (T_a)* Response time or adjustment time (T_a) is the time scale
10 characterizing the decay of an instantaneous pulse input into the *reservoir*. The term adjustment time is also
11 used to characterize the adjustment of the mass of a reservoir following a step change in the *source* strength.
12 Half-life or decay constant is used to quantify a first-order exponential decay process. See *Response time or*
13 *adjustment time* for a different definition pertinent to *climate* variations.

14
15 The term lifetime is sometimes used, for simplicity, as a surrogate for adjustment time.

16
17 In simple cases, where the global removal of the compound is directly proportional to the total mass of the
18 reservoir, the adjustment time equals the *turnover time*: $T = T_a$. An example is CFC-11, which is removed
19 from the *atmosphere* only by photochemical processes in the *stratosphere*. In more complicated cases, where
20 several reservoirs are involved or where the removal is not proportional to the total mass, the equality $T = T_a$
21 no longer holds.

22
23 *Carbon dioxide (CO₂)* is an extreme example. Its turnover time is only about 4 years because of the rapid
24 exchange between the atmosphere and the ocean and terrestrial biota. However, a large part of that CO₂ is
25 returned to the atmosphere within a few years. The adjustment time of CO₂ in the atmosphere is determined
26 from the rates of removal of carbon by a range of processes with timescales from months to hundreds of
27 thousands of years. As a result, 15 to 40% of an emitted CO₂ pulse will remain in the atmosphere longer than
28 1,000 years, 10 to 25% will remain about ten thousand years, and the rest will be removed over several
29 hundred thousand years.

30
31 In the case of *methane (CH₄)*, the adjustment time is different from the turnover time because the removal is
32 mainly through a chemical reaction with the hydroxyl radical (OH), the concentration of which itself
33 depends on the CH₄ concentration. Therefore, the CH₄ removal rate S is not proportional to its total mass M.

34
35 *Turnover time (T)* (also called global atmospheric lifetime) is the ratio of the mass M of a *reservoir* (e.g., a
36 gaseous compound in the *atmosphere*) and the total rate of removal S from the *reservoir*: $T = M/S$. For each
37 removal process, separate turnover times can be defined. In soil carbon biology, this is referred to as Mean
38 Residence Time.

39
40 **Light-absorbing particles** Light-absorbing particles (LAP), e.g., black carbon, brown carbon, dust, are
41 particles that absorb solar radiation and convert it into internal energy, thus raising the particle's temperature
42 and emitting thermal-infrared radiation that is selectively absorbed by the surrounding medium. LAP affect
43 the energy balance of the atmosphere, clouds, and when deposited on snow and ice, they reduce snow/ice
44 albedo, increasing heating and accelerating smelting. These particles have a warming effect on climate.

45
46 **Likelihood** The chance of a specific outcome occurring, where this might be estimated probabilistically.
47 Likelihood is expressed in this report using a standard terminology (Mastrandrea et al., 2010). See also
48 *Agreement*, *Confidence*, *Evidence* and *Uncertainty*.

49
50 **Lithosphere** The upper layer of the solid Earth, both continental and oceanic, which comprises all crustal
51 rocks and the cold, mainly elastic part of the uppermost mantle. Volcanic activity, although part of the
52 *lithosphere*, is not considered as part of the *climate system*, but acts as an *external forcing* factor.

53
54 **Livelihood** The resources used and the activities undertaken in order for people to live. Livelihoods are
55 usually determined by the entitlements and assets to which people have access. Such assets can be

1 categorised as human, social, natural, physical, or financial.

2
3 **Local sea level change** See *Sea level change (sea level rise/sea level fall)*.

4
5 **Long-lived climate forcers (LLCFs)** A set of well-mixed *greenhouse gases* with long atmospheric
6 lifetimes. This set of compounds includes *carbon dioxide (CO₂)* and *nitrous oxide (N₂O)*, together with some
7 fluorinated gases. They have a warming effect on *climate*. These compounds accumulate in the atmosphere
8 at decadal to centennial timescales, and their effect on climate hence persists for decades to centuries after
9 their emission. On timescales of decades to a century already emitted emissions of long-lived climate forcers
10 can only be abated by *greenhouse gas removal (GGR)*.

11
12 **Longwave radiation** See *Terrestrial radiation*.

13
14 **Low-likelihood, high impact events** Events whose probability of occurrence is low or not well known (as
15 in the context of deep uncertainty) but whose potential impacts on society and ecosystems could be high. To
16 better inform risk assessment and decision-making, such low-likelihood outcomes are considered if they are
17 associated with very large consequences and may therefore constitute material risks, even though those
18 consequences do not necessarily represent the most likely outcome.

19
20 **Madden-Julian Oscillation (MJO)** The largest mode of tropical atmospheric intraseasonal variability
21 with typical periods ranging from 20 to 90 days. The MJO corresponds to planetary-scale disturbances of
22 pressure, wind and deep convection moving predominantly eastward along the equator. As it progresses, the
23 MJO is associated with the temporal alternation of large-scale enhanced and suppressed rainfall, with
24 maximum loading over the Indian and western Pacific oceans, although influences of the MJO can be
25 tracked over the Atlantic/Africa in dynamical fields. See Section AIV.2.8 in Annex IV of the AR6 WGI
26 report.

27
28 **Maladaptive actions (Maladaptation)** Actions that may lead to increased risk of adverse climate-related
29 outcomes, including via increased greenhouse gas (GHG) emissions, increased vulnerability to climate
30 change, or diminished welfare, now or in the future. Maladaptation is usually an unintended consequence.

31
32 **Marine cloud brightening (MCB)** See *Solar radiation modification (SRM)*.

33
34 **Marine heatwave** A period during which water temperature is abnormally warm for the time of the year
35 relative to historical temperatures with that extreme warmth persisting for days to months. The phenomenon
36 can manifest in any place in the ocean and at scales of up to thousands of kilometres. See also *Heatwave*.

37
38 **Marine ice cliff instability (MICI)** A hypothetical mechanism of an ice cliff failure. In case a marine-
39 terminated *ice sheet* loses its buttressing *ice shelf*, an ice cliff can be exposed. If the exposed ice cliff is tall
40 enough (about 800 m of the total height, or about 100 m of the above-water part), the stresses at the cliff face
41 exceed the strength of the ice, and the cliff fails structurally in repeated *calving* events. See also *Marine ice*
42 *sheet instability (MISI)*.

43
44 **Marine ice sheet instability (MISI)** A mechanism of irreversible (on the decadal to centennial time scale)
45 retreat of a *grounding line* for the marine-terminating *glaciers*, in case the glacier bed slopes towards the *ice*
46 *sheet* interior. See also *Marine ice cliff instability (MICI)*.

47
48 **Marine isotope stage (MIS)** Geological periods of alternating glacial and interglacial conditions, each
49 typically lasting tens of thousands of years as inferred from the oxygen isotope composition of microfossils
50 from deep sea sediment cores. MIS numbers increase back in time from the present, which is MIS 1. Even-
51 number MISs coincide with glacial periods, and odd-numbered MISs are interglacials.

52
53 **Marine-based ice sheet** An *ice sheet* containing a substantial *region* that rests on a bed lying below sea
54 level and whose perimeter is in contact with the ocean. The best known example is the West Antarctic ice
55 sheet.

1
2 **Mass balance / budget (of glaciers or ice sheets)** Difference between the mass input (*accumulation*) and
3 the mass loss (*ablation*) of an ice body (e.g., a glacier or ice sheet) over a stated time period, which is often a
4 year or a season. Surface mass balance refers to the difference between surface accumulation and surface
5 ablation.
6

7 *Ablation (of glaciers, ice sheets, or snow cover)* All processes that reduce the mass of a *glacier, ice sheet,*
8 or snow cover. The main processes are melting, and for glaciers also *calving* (or, when the glacier nourishes
9 an *ice shelf, discharge of ice* across the *grounding line*), but other processes such as sublimation and loss of
10 wind-blown snow can also contribute to ablation. Ablation also refers to the mass lost by any of these
11 processes.
12

13 *Accumulation (of glaciers, ice sheets, or snow cover)* All processes that add to the mass of a *glacier, an ice*
14 *sheet,* or snow cover. The main process of accumulation is snowfall. Accumulation also includes deposition
15 of hoar, freezing rain, other types of solid precipitation, gain of wind-blown snow, avalanching, and basal
16 accumulation (often beneath floating ice).
17

18 *Discharge (of ice)* Rate of the flow of ice through a vertical section of a *glacier* perpendicular to the
19 direction of the flow of ice. Often used to refer to the loss of mass at marine-terminating glacier fronts
20 (mostly *calving of icebergs* and submarine melt), or to mass flowing across the *grounding line* of a floating
21 ice shelf.
22

23 **Mean sea level** The surface level of the ocean at a particular point averaged over an extended period of
24 time such as a month or year. Mean sea level is often used as a national datum to which heights on land are
25 referred.
26

27 **Medieval Climate Anomaly (MCA)** See *Medieval Warm Period (MWP)*.
28

29 **Megacity** Urban agglomerations with 10 million inhabitants or more.
30

31 **Meltwater Pulse 1A (MWP-1A)** A particular interval of rapid global *sea level rise* between about 14,700
32 and 14,300 years ago, associated with the end of the last *ice age* and attributed to freshwater flux to the
33 ocean from accelerated melting of *ice sheets* and *glaciers*. First defined based on oxygen *isotope* data
34 (Duplessy et al., 1981), and later shown to be reflected by high rates of sea-level rise (Fairbanks, 1989). See
35 also *Deglacial or deglaciation or glacial termination*.
36

37 **Meridional overturning circulation (MOC)** Meridional (north-south) overturning circulation in the
38 *ocean* quantified by zonal (east-west) sums of mass transports in depth or density layers. In the North
39 Atlantic, away from the subpolar regions, the MOC (which is in principle an observable quantity) is often
40 identified with the thermohaline circulation (THC), which is a conceptual and incomplete interpretation. The
41 MOC is also driven by wind, and can also include shallower overturning cells such as occur in the upper
42 ocean in the tropics and subtropics, in which warm (light) waters moving poleward are transformed to
43 slightly denser waters and subducted equatorward at deeper levels.
44

45 *Atlantic Meridional Overturning Circulation (AMOC)* The main current system in the South and North
46 Atlantic Oceans. AMOC transports warm upper-ocean water northwards, and cold, deep water southwards,
47 as part of the global ocean circulation system. Changes in the strength of AMOC can affect other
48 components of the *climate system*.
49

50 **Meteorological drought** See *Drought*.
51

52 **Methane (CH₄)** One of the seven greenhouse gases (GHGs) to be mitigated under the Kyoto Protocol.
53 Methane is the major component of natural gas and associated with all hydrocarbon fuels. Significant
54 anthropogenic emissions also occur as a result of animal husbandry and paddy rice production. Methane is
55 also produced naturally where organic matter decays under anaerobic conditions, such as in wetlands. Under

1 future global warming, there is risk of increased methane emissions from thawing permafrost, coastal
2 wetlands and sub-sea gas hydrates. See also *Short-lived climate forcers (SLCFs)*.

3
4 **Microclimate** Local climate at or near the Earth's surface.

5
6 **Microwave sounding unit (MSU)** A microwave sounder on National Oceanic and Atmospheric
7 Administration (NOAA) polar orbiter satellites, that estimates the temperature of thick layers of the
8 *atmosphere* by measuring the thermal emission of oxygen molecules from a complex of emission lines near
9 60 GHz. A series of nine MSUs began making this kind of measurement in late 1978. Beginning in mid-
10 1998, a follow-on series of instruments, the Advanced Microwave Sounding Units (AMSUs), began
11 operation.

12
13 **Mid-Holocene (MH)** See *Holocene*.

14
15 **Mid-Pliocene Warm Period (MPWP)** See *Pliocene*.

16
17 **Mineralisation/Remineralisation** The conversion of an element from its organic form to an inorganic
18 form as a result of microbial decomposition. In nitrogen mineralisation, organic nitrogen from decaying plant
19 and animal residues (proteins, nucleic acids, amino sugars and urea) is converted to ammonia (NH₃) and
20 ammonium (NH₄⁺) by biological activity.

21
22 **Mitigation (of climate change)** A human intervention to reduce emissions or enhance the sinks of
23 greenhouse gases.

24
25 **Mitigation potential** The quantity of net greenhouse gas emission reductions that can be achieved by a
26 given mitigation option relative to specified emission baselines. [Note: Net greenhouse gas emission
27 reductions is the sum of reduced emissions and/or enhanced sinks.] See also *Sequestration potential*.

28
29 **Biogeophysical potential** The mitigation potential constrained by biological, geophysical and geochemical
30 limits and thermodynamics, without taking into account technical, social, economic, and/or environmental
31 considerations.

32
33 **Economic potential** The portion of the technical potential for which the social benefits exceed the social
34 costs, taking into account a social discount rate and the value of externalities

35
36 **Technical potential** The mitigation potential constrained by biogeophysical limits as well as availability of
37 technologies and practices. Quantification of technical potentials takes into account primarily technical
38 considerations, but social, economic and/or environmental considerations are occasionally also included, if
39 these represent strong barriers for the deployment of an option.

40
41 **Mitigation scenario** See *Scenario*.

42
43 **Mixing ratio** See *Mole fraction or mixing ratio*.

44
45 **Model bias** See *Biases*.

46
47 **Model drift** Since model *climate* differs to some extent from observed climate, *climate forecasts* will
48 typically 'drift' from the initial observation-based state towards the model's climate. This drift occurs at
49 different time scales for different variables, can obscure the initial-condition forecast information and is
50 usually removed a posteriori by an empirical, usually linear, adjustment.

51
52 **Model initialization** A *climate prediction* typically proceeds by integrating a *climate model* forward in
53 time from an initial state that is intended to reflect the actual state of the *climate system*. Available
54 observations of the climate system are 'assimilated' into the model. Initialization is a complex process that is
55 limited by available observations, observational errors and, depending on the procedure used, may be

1 affected by *uncertainty* in the history of *climate* forcing. The initial conditions will contain errors that grow
2 as the forecast progresses, thereby limiting the time for which the forecast will be useful.

3
4 **Model spread** The range or spread in results from *climate models*, such as those assembled for Coupled
5 Model Intercomparison Project Phase 6 (CMIP6). Does not necessarily provide an exhaustive and formal
6 estimate of the *uncertainty* in *feedbacks*, forcing or *projections* even when expressed numerically, for
7 example, by computing a standard deviation of the models' responses. In order to quantify uncertainty,
8 information from observations, physical constraints and expert judgement must be combined, using a
9 statistical framework.

10
11 **Modes of climate variability** Recurrent space-time structures of *natural variability* of the *climate system*
12 with intrinsic spatial patterns, seasonality and time scales. Modes can arise through the dynamical
13 characteristics of the atmospheric circulation but also through coupling between the ocean and the
14 *atmosphere*, with some interactions with land surfaces and *sea ice*. Many modes of variability are driven by
15 internal climate processes and are a critical potential source of climate predictability on sub-seasonal to
16 decadal time scales. See Annex IV of the AR6 WGI report. See also *Annular modes*, *Tropical Atlantic*
17 *Variability (TAV)*, *Indian Ocean Dipole (IOD)*, *Indian Ocean Basin (IOB) mode*, *Pacific Decadal Variability*
18 *(PDV)*, *Pacific Decadal Oscillation (PDO)* (under *Pacific Decadal Variability (PDV)*), *El Niño-Southern*
19 *Oscillation (ENSO)*, *North Atlantic Oscillation (NAO)*, *Northern Annular Mode (NAM)* (under *Annular*
20 *modes*), *Southern Annular Mode (SAM)* (under *Annular modes*), *Atlantic Meridional Mode (AMM)* (under
21 *Tropical Atlantic Variability (TAV)*), *Atlantic Zonal Mode (AZM)* (under *Tropical Atlantic Variability*
22 *(TAV)*), *Madden-Julian Oscillation (MJO)*, *Atlantic Multidecadal Variability (AMV)* and *Interdecadal*
23 *Pacific Oscillation (IPO)* (under *Pacific Decadal Variability (PDV)*).

24
25 **Mole fraction or mixing ratio** Mole fraction, or mixing ratio, is the ratio of the number of moles of a
26 constituent in a given volume to the total number of moles of all constituents in that volume. It is usually
27 reported for dry air. Typical values for well-mixed greenhouse gases are in the order of $\mu\text{mol mol}^{-1}$ (parts per
28 million: ppm), nmol mol^{-1} (parts per billion: ppb), and fmol mol^{-1} (parts per trillion: ppt). Mole fraction
29 differs from volume mixing ratio, often expressed in ppmv etc., by the corrections for non-ideality of gases.
30 This correction is significant relative to measurement precision for many greenhouse gases (Schwartz and
31 Warneck, 1995).

32
33 **Monsoon** See *Global monsoon*.

34
35 **Montreal Protocol** The Montreal Protocol on Substances that Deplete the Ozone Layer was adopted in
36 Montreal in 1987, and subsequently adjusted and amended in London (1990), Copenhagen (1992), Vienna
37 (1995), Montreal (1997) and Beijing (1999). It controls the consumption and production of chlorine- and
38 bromine-containing chemicals that destroy stratospheric ozone (O_3), such as chlorofluorocarbons (CFCs),
39 methyl chloroform, carbon tetrachloride and many others.

40
41 **Multi-model ensemble (MME)** See *Climate simulation ensemble*. See also *Ensemble*.

42
43 **Narrative** See *Storyline*. See also *Pathways*.

44
45 **Natural systems** The dynamic physical and biological components of the environment that would operate
46 in the absence of human impacts. Most, if not all, natural systems are also now affected by human activities
47 to some degree.

48
49 **Natural variability** See *Climate variability*.

50
51 **Near-surface permafrost** See *Permafrost*.

52
53 **Negative greenhouse gas emissions** Removal of *greenhouse gases (GHGs)* from the *atmosphere* by
54 deliberate human activities, i.e., in addition to the removal that would occur via natural carbon cycle or
55 atmospheric chemistry processes. See also *Carbon dioxide removal (CDR)*, *Greenhouse gas removal (GGR)*,

1 *Negative CO₂ emissions, Net negative greenhouse gas emissions, Net zero CO₂ emissions and Net zero*
2 *greenhouse gas emissions.*

3
4 **Net negative greenhouse gas emissions** A situation of net negative greenhouse gas emissions is achieved
5 when metric-weighted anthropogenic greenhouse gas (GHG) removals exceed metric-weighted
6 anthropogenic GHG emissions. Where multiple GHG are involved, the quantification of net emissions
7 depends on the metric chosen to compare emissions of different gases (such as *global warming potential*,
8 *global temperature change potential*, and others, as well as the chosen time horizon). See also *Net zero CO₂*
9 *emissions, Net zero greenhouse gas emissions, Negative greenhouse gas emissions, Carbon dioxide removal*
10 *(CDR), Greenhouse gas removal (GGR) and Greenhouse gas emission metric.*

11
12 **Net primary production (NPP)** See *Primary production.*

13
14 **Net zero CO₂ emissions** Condition in which anthropogenic carbon dioxide (CO₂) emissions are balanced
15 by anthropogenic CO₂ removals over a specified period. [Note: Carbon neutrality and net zero CO₂
16 emissions are overlapping concepts. The concepts can be applied at global or sub-global scales (e.g.,
17 regional, national and sub-national). At a global scale, the terms carbon neutrality and net zero CO₂
18 emissions are equivalent. At sub-global scales, net zero CO₂ emissions is generally applied to emissions and
19 removals under direct control or territorial responsibility of the reporting entity, while carbon neutrality
20 generally includes emissions and removals within and beyond the direct control or territorial responsibility of
21 the reporting entity. Accounting rules specified by GHG programmes or schemes can have a significant
22 influence on the quantification of relevant CO₂ emissions and removals.] See also *Net zero greenhouse gas*
23 *emissions, Carbon neutrality and Land use, land-use change and forestry (LULUCF).*

24
25 **Net zero greenhouse gas emissions** Condition in which metric-weighted anthropogenic greenhouse gas
26 (GHG) emissions are balanced by metric-weighted anthropogenic GHG removals over a specified period.
27 The quantification of net zero GHG emissions depends on the GHG emission metric chosen to compare
28 emissions and removals of different gases, as well as the time horizon chosen for that metric.

29
30 [Note 1: GHG neutrality and net zero GHG emissions are overlapping concepts. The concept of net zero
31 GHG emissions can be applied at global or sub-global scales (e.g., regional, national and sub-national). At a
32 global scale, the terms GHG neutrality and net zero GHG emissions are equivalent. At sub-global scales, net
33 zero GHG emissions is generally applied to emissions and removals under direct control or territorial
34 responsibility of the reporting entity, while GHG neutrality generally includes anthropogenic emissions and
35 anthropogenic removals within and beyond the direct control or territorial responsibility of the reporting
36 entity. Accounting rules specified by GHG programmes or schemes can have a significant influence on the
37 quantification of relevant emissions and removals.

38
39 Note 2. Under the Paris Rulebook [Decision 18/CMA.1, annex, paragraph 37], parties have agreed to use
40 GWP100 values from the IPCC AR5 or GWP100 values from a subsequent IPCC Assessment Report to
41 report aggregate emissions and removals of GHGs. In addition, parties may use other metrics to report
42 supplemental information on aggregate emissions and removals of GHGs.]

43
44 See also *Net zero CO₂ emissions, Greenhouse gas emission metric, Greenhouse gas neutrality and Land use,*
45 *land-use change and forestry (LULUCF).*

46
47 **Nitrogen deposition** Nitrogen deposition is defined as the nitrogen transferred from the *atmosphere* to the
48 Earth's surface by the processes of wet deposition and dry deposition.

49
50 **Nitrous oxide (N₂O)** One of the seven *greenhouse gases (GHGs)* to be mitigated under the Kyoto
51 Protocol. The main anthropogenic source of N₂O is agriculture (soil and animal manure management), but
52 important contributions also come from sewage treatment, *fossil fuel* combustion, and chemical industrial
53 processes. N₂O is also produced naturally from a wide variety of biological sources in soil and water,
54 particularly microbial action in wet tropical forests.

- 1 **Non-CO₂ emissions and radiative forcing** Non-CO₂ emissions included in this report are all
2 *anthropogenic emissions* other than CO₂ that result in *radiative forcing*. These include *short-lived climate*
3 *forcers*, such as *methane (CH₄)*, some fluorinated gases, *ozone (O₃)* precursors, *aerosols* or aerosol
4 *precursors*, such as *black carbon* and sulphur dioxide, respectively, as well as long-lived *greenhouse gases*,
5 such as *nitrous oxide (N₂O)* or other fluorinated gases. The radiative forcing associated with non-CO₂
6 emissions and changes in surface *albedo* (e.g., resulting from land-use change) is referred to as non-CO₂
7 radiative forcing.
8
- 9 **Non-methane volatile organic compounds (NMVOCs)** See *Volatile organic compounds (VOCs)*.
- 10
- 11 **Nonlinearity** A process is called nonlinear when there is no simple proportional relation between cause
12 and effect. The *climate system* contains many such nonlinear processes, resulting in a system with potentially
13 very complex behaviour. Such complexity may lead to *abrupt climate change*.
14
- 15 **North American monsoon (NAmerM)** See *Global monsoon*.
- 16
- 17 **Northern Annular Mode (NAM)** See *Annular modes*.
- 18
- 19 **North Atlantic Oscillation (NAO)** The leading mode of large-scale atmospheric variability in the North
20 Atlantic basin characterized by alternating (see-saw) variations in sea-level pressure or geopotential height
21 between the Azores High in the subtropics and the Icelandic Low in the mid- to high latitudes, with some
22 northward extension deep into the Arctic. It is associated with fluctuations in strength and latitudinal position
23 of the main westerly winds across a vast North Atlantic-Europe domain, and thus with fluctuations in the
24 embedded extratropical cyclones and associated frontal systems leading to strong *teleconnection* over the
25 entire North Atlantic adjacent continents. The positive and negative phases of the NAO show similar
26 characteristics described for the *Northern Annular Mode (NAM)*. See Section AIV.2.1 in Annex IV of the
27 AR6 WGI report.
28
- 29 **Northern polar vortex** See *Stratospheric polar vortex*.
- 30
- 31 **Ocean** The interconnected body of saline water that covers 71% of the Earth's surface, contains 97% of the
32 Earth's water and provides 99% of the Earth's biologically-habitable space. It includes the Arctic, Atlantic,
33 Indian, Pacific and Southern Oceans, as well as their marginal seas and coastal waters.
34
- 35 **Ocean acidification (OA)** A reduction in the *pH* of the *ocean*, accompanied by other chemical changes
36 (primarily in the levels of carbonate and bicarbonate ions), over an extended period, typically decades or
37 longer, which is caused primarily by *uptake* of *carbon dioxide (CO₂)* from the *atmosphere*, but can also be
38 caused by other chemical additions or subtractions from the ocean. *Anthropogenic* OA refers to the
39 component of pH reduction that is caused by human activity (IPCC, 2011, p. 37).
40
- 41 **Ocean alkalisation / Ocean alkalinity enhancement** A proposed carbon dioxide removal method that
42 involves deposition of alkaline minerals or their dissociation products at the ocean surface. This increases
43 surface total alkalinity, and may thus increase ocean CO₂ uptake and ameliorate surface ocean acidification.
44 See also *Anthropogenic removals* and *Carbon dioxide removal (CDR)*.
45
- 46 **Ocean carbon cycle** The ocean *carbon cycle* is the set of processes that exchange carbon between various
47 pools within the ocean, as well as between the *atmosphere*, Earth's interior, *cryosphere*, and the seafloor. See
48 also *Carbon cycle*.
49
- 50 **Ocean deoxygenation** The loss of oxygen in the *ocean*. It results from ocean warming, which reduces
51 oxygen solubility and increases oxygen consumption and *stratification*, thereby reducing the mixing of
52 oxygen into the ocean interior. Deoxygenation can also be exacerbated by the addition of excess nutrients in
53 the *coastal zone*.
54
- 55 **Ocean dynamic sea level change** See *Sea level change (sea level rise/sea level fall)*.

1
2 **Ocean fertilisation** A proposed carbon dioxide removal method that relies on the deliberate increase of
3 nutrient supply to the near-surface ocean with the aim of sequestering additional CO₂ from the atmosphere
4 through biological production. Methods include direct addition of micro-nutrients or macro-nutrients. To be
5 successful, the additional carbon needs to reach the deep ocean where it has the potential to be sequestered
6 on climatically-relevant timescales. See also *Anthropogenic removals* and *Carbon dioxide removal (CDR)*.
7

8 **Ocean heat uptake efficiency** This is a measure (W m⁻² °C⁻¹) of the rate at which heat storage by the
9 global ocean increases as global surface temperature rises. It is a useful parameter for *climate change*
10 simulations in which the *radiative forcing* is changing monotonically, when it can be compared with the
11 *climate feedback parameter* to gauge the relative importance of radiative response and ocean heat *uptake* in
12 determining the rate of *climate change*. It can be estimated from such an experiment as the ratio of the rate of
13 increase of ocean heat content to the surface temperature change.
14

15 **Ocean stratification** See *Stratification*.

16
17 **Orbital forcing** *Orbital forcing* is the influence of slow, systematic and predictable changes in orbital
18 parameters (eccentricity, obliquity and precession of the equinox) on incoming solar radiation (*insolation*),
19 especially its latitudinal and seasonal distribution. It is an *external forcing* and a key driver of *glacial-*
20 *interglacial cycles*.
21

22 **Organic aerosol** Component of the *aerosol* that consists of organic compounds, mainly carbon, hydrogen,
23 oxygen and lesser amounts of other elements.
24

25 **Outgoing longwave radiation** Net outgoing radiation in the infrared part of the spectrum at the top of the
26 *atmosphere*.
27

28 **Outlet glacier** See *Glacier*.
29

30 **Oxygen minimum zone (OMZ)** The midwater layer (200–1000 m) in the open ocean in which oxygen
31 saturation is the lowest in the ocean. The degree of oxygen depletion depends on the largely bacterial
32 consumption of organic matter and the distribution of the OMZs is influenced by large-scale ocean
33 circulation. In coastal oceans, OMZs extend to the shelves and may also affect benthic ecosystems.
34

35 **Ozone (O₃)** The triatomic form of oxygen, and a gaseous *atmospheric* constituent. In the troposphere, O₃ is
36 created both naturally and by photochemical reactions involving gases resulting from human activities (e.g.,
37 smog). Tropospheric O₃ acts as a *greenhouse gas (GHG)*. In the stratosphere, O₃ is created by the interaction
38 between solar ultraviolet radiation and molecular oxygen (O₂). Stratospheric O₃ plays a dominant role in the
39 stratospheric radiative balance. Its concentration is highest in the ozone layer. See also *Ground-level ozone*,
40 *Ozone hole*, *Ozone layer*, *Ozone-depleting substances (ODSs)*, *Ozonesonde* and *Short-lived climate forcers*
41 *(SLCFs)*.
42

43 **Ozone layer** The ozone layer is a layer of Earth's *stratosphere* that absorbs most of the Sun's ultraviolet
44 radiation. It contains high concentrations of *ozone (O₃)* in relation to other parts of the *atmosphere*, although
45 still small in relation to other gases in the stratosphere. The ozone layer contains less than 10 parts per
46 million of ozone, while the average ozone concentration in Earth's atmosphere as a whole is about 0.3 parts
47 per million. The ozone layer is mainly found in the lower portion of the stratosphere, from approximately 15
48 to 35 kilometres (9.3 to 21.7 miles) above Earth, although its thickness varies seasonally and geographically.
49 See also *Ozone hole* and *Ozone-depleting substances (ODSs)*.
50

51 **Ozone-depleting substances (ODSs)** Ozone-depleting substances (ODSs) are man-made gases that
52 destroy *ozone (O₃)* once they reach the *ozone layer* in the *stratosphere*. Ozone depleting substances include:
53 *chlorofluorocarbons (CFCs)*, *hydrochlorofluorocarbons (HCFCs)*, *hydrobromofluorocarbons (HBFCs)*,
54 *halons*, *methyl bromide*, *carbon tetrachloride* and *methyl chloroform*. They are used as refrigerants in
55 commercial, home and vehicle air conditioners and refrigerators, foam blowing agents, components in

1 electrical equipment, industrial solvents, solvents for cleaning (including dry cleaning), aerosol spray
2 propellants and fumigants. See also *Ozone layer*, *Ozone (O₃)* and *Stratospheric ozone*.

3
4 **Ozonesonde** An ozonesonde is a radiosonde measuring *ozone (O₃)* concentrations. The radiosonde is
5 usually carried on a weather balloon and transmits measured quantities by radio to a ground-based receiver.

6
7 **Pacific Decadal Oscillation (PDO)** See *Pacific Decadal Variability (PDV)*.

8
9 **Pacific Decadal Variability (PDV)** Coupled decadal-to-interdecadal variability of the atmospheric
10 circulation and underlying ocean that is typically observed over the entire Pacific Basin beyond the *El Niño-*
11 *Southern Oscillation (ENSO)* timescale. In the AR6 WGI report, PDV encapsulates the *Pacific Decadal*
12 *Oscillation (PDO)*, the South Pacific Decadal Oscillation (SPDO), tropical Pacific decadal variability (also
13 called decadal ENSO), and the Interdecadal Pacific Oscillation (IPO). Typically, the positive phase of the
14 PDV is characterized by anomalously high *sea surface temperatures* in the central-eastern tropical Pacific
15 that extend to the extratropical North and South Pacific along the American coasts, encircled to the west by
16 cold sea surface anomalies in the mid-latitude North and South Pacific. The negative phase is accompanied
17 by sea surface temperature anomalies in the opposite sign. Those sea surface temperature anomalies are
18 linked to anomalies in atmospheric and oceanic circulation throughout the whole Pacific Basin. The PDV is
19 associated with decadal modulations in the relative occurrence of El Niño and La Niña. See Section AIV.2.6
20 in Annex IV of the AR6 WGI report.

21
22 *Interdecadal Pacific Oscillation (IPO)* An equatorially symmetric pattern of *sea surface temperature*
23 variability at decadal-to-interdecadal timescales. While the *Pacific Decadal Oscillation (PDO)* and its South
24 Pacific counterpart, the South Pacific Decadal Oscillation (SPDO), are considered as physically distinct
25 modes, the tropical Pacific decadal-interdecadal variability can drive both the PDO and SPDO, forming the
26 IPO as a synchronized pan-Pacific variability. Its spatial pattern of sea surface temperature anomalies is
27 similar to that of the *El Niño-Southern Oscillation (ENSO)*, but with a broader meridional extent in the
28 tropical signal and more weights in the extratropics compared to the tropics. In the AR6 WGI report, it is
29 encapsulated within the definition and description of the *Pacific Decadal Variability (PDV)*. See also Section
30 AIV.2.6 in Annex IV of the AR6 WGI report.

31
32 *Pacific Decadal Oscillation (PDO)* The leading mode of variability obtained from decomposition in
33 empirical orthogonal function of *sea surface temperature* over the North Pacific north of 20°N, and
34 characterized by a strong decadal component. The positive phase of the PDO features a dipole of sea surface
35 temperature anomalies in the North Pacific, with a cold lobe near the center of the basin and extending
36 westward along the Kuroshio, encircled by warmer conditions along the coast of North America and in the
37 subtropics. A positive PDO is accompanied by an intensified Aleutian Low and an associated cyclonic
38 circulation enhancement leading to *teleconnections* over the continents adjacent to the North Pacific. In AR6
39 WGI report, the PDO is encapsulated within the definition and description of *Pacific Decadal Variability*
40 (*PDV*). See also Section AIV.2.6 in Annex IV of the AR6 WGI report.

41
42 **Pacific-North American (PNA) pattern** An atmospheric large-scale wave pattern featuring a sequence of
43 tropospheric high and low pressure anomalies stretching from the subtropical west Pacific to the east coast of
44 North America. See also *Pacific-South American (PSA) pattern*.

45
46 **Palaeocene-Eocene Thermal Maximum (PETM)** The PETM is a transient event that occurred between
47 55.9 and 55.7 million years ago. Continental positions at this time were somewhat different to present due to
48 tectonic plate movements. Geological data indicate that the PETM was characterised by a warming (*global*
49 *mean surface temperature* rose to about 4-7 °C warmer than the preceding mean state), and an increase in
50 atmospheric CO₂ (from about 900 to about 2000 ppmv). In addition, ocean *pH* and oxygen content
51 decreased; many deep-sea species went extinct and tropical *coral reefs* diminished.

52
53 **Paleoclimate** Climate during periods prior to the development of measuring instruments, including historic
54 and geologic time, for which only *proxy* climate records are available.

1 **Parameterisation** In *climate models*, this term refers to the technique of representing processes that cannot
2 be explicitly resolved at the spatial or temporal *resolution* of the model (sub-grid scale processes) by
3 relationships between model-resolved larger-scale variables and the area- or time-averaged effect of such
4 subgrid scale processes.

5
6 **Pathways** The temporal evolution of natural and/or human systems towards a future state. Pathway
7 concepts range from sets of quantitative and qualitative *scenarios* or *narratives* of potential futures to
8 solution-oriented decision-making processes to achieve desirable societal goals. Pathway approaches
9 typically focus on biophysical, techno-economic, and/or socio-behavioural trajectories and involve various
10 dynamics, goals, and actors across different scales. See also *Scenario storyline* (under *Storyline*), *Mitigation*
11 *scenario* (under *Scenario*), *Baseline scenario* (under *Scenario*) and *Stabilisation (of GHG or CO₂-equivalent*
12 *concentration)*.

13
14 *1.5°C pathway* A pathway of emissions of greenhouse gases and other climate forcings that provides an
15 approximately one-in-two to two-in-three chance, given current knowledge of the climate response, of global
16 warming either remaining below 1.5°C or returning to 1.5°C by around 2100 following an overshoot.

17
18 *Representative concentration pathways (RCPs)* *Scenarios* that include time series of *emissions* and
19 concentrations of the full suite of *greenhouse gases (GHGs)* and *aerosols* and chemically active gases, as
20 well as *land use/land cover* (Moss et al., 2010). The word representative signifies that each RCP provides
21 only one of many possible scenarios that would lead to the specific *radiative forcing* characteristics. The
22 term pathway emphasises that not only the long-term concentration levels are of interest, but also the
23 trajectory taken over time to reach that outcome (Moss et al., 2010).

24
25 RCPs usually refer to the portion of the concentration pathway extending up to 2100, for which *Integrated*
26 *assessment models* produced corresponding emission scenarios. Extended concentration pathways describe
27 extensions of the RCPs from 2100 to 2300 that were calculated using simple rules generated by stakeholder
28 consultations, and do not represent fully consistent scenarios. Four RCPs produced from Integrated
29 assessment models were selected from the published literature and are used in the Fifth IPCC Assessment
30 and also used in this Assessment for comparison, spanning the range from approximately below 2°C
31 warming to high (>4°C) warming best-estimates by the end of the 21st century: RCP2.6, RCP4.5 and
32 RCP6.0 and RCP8.5.

- 33
34 • RCP2.6: One pathway where radiative forcing peaks at approximately 3 W m⁻² and then declines to be
35 limited at 2.6 W m⁻² in 2100 (the corresponding Extended Concentration Pathway, or ECP, has constant
36 emissions after 2100).
37 • RCP4.5 and RCP6.0: Two intermediate stabilisation pathways in which radiative forcing is limited at
38 approximately 4.5 W m⁻² and 6.0 W m⁻² in 2100 (the corresponding ECPs have constant concentrations after
39 2150).
40 • RCP8.5: One high pathway which leads to >8.5 W m⁻² in 2100 (the corresponding ECP has constant
41 emissions after 2100 until 2150 and constant concentrations after 2250).

42
43 See also *Coupled Model Intercomparison Project (CMIP)* and *Shared socio-economic pathways (SSPs)*
44 (under *Pathways*).

45
46 *Shared socio-economic pathways (SSPs)* Shared socio-economic pathways (SSPs) have been developed to
47 complement the *Representative concentration pathways (RCPs)*. By design, the RCP emission and
48 concentration pathways were stripped of their association with a certain socio-economic development.
49 Different levels of *emissions* and *climate change* along the dimension of the RCPs can hence be explored
50 against the backdrop of different socio-economic development pathways (SSPs) on the other dimension in a
51 matrix. This integrative SSP-RCP framework is now widely used in the climate *impact* and policy analysis
52 literature, where *climate projections* obtained under the RCP scenarios are analysed against the backdrop of
53 various SSPs. As several emission updates were due, a new set of emission scenarios was developed in
54 conjunction with the SSPs. Hence, the abbreviation SSP is now used for two things: On the one hand SSP1,
55 SSP2, ..., SSP5 is used to denote the five socio-economic scenario families. On the other hand, the

1 abbreviations SSP1-1.9, SSP1-2.6, ..., SSP5-8.5 are used to denote the newly developed emission scenarios
2 that are the result of an SSP implementation within an integrated assessment model. Those SSP scenarios are
3 bare of climate policy assumption, but in combination with so-called shared policy assumptions (SPAs),
4 various approximate *radiative forcing* levels of 1.9, 2.6, ..., or 8.5 W m⁻² are reached by the end of the
5 century, respectively.

6
7 **Pattern scaling** Techniques used to represent the spatial variations in *climate* at a given increase in *global*
8 *mean surface air temperature (GSAT)* are referred to as ‘pattern scaling’.

9
10 **Peat** Soft, porous or compressed, sedimentary deposit of which a substantial portion is partly decomposed
11 plant material with high water content in the natural state (up to about 90%).

12
13 **Peatlands** Peatland is a land where soils are dominated by *peat*.

14
15 **Percentile** A partition value in a population distribution that a given percentage of the data values are
16 below or equal to. The 50th percentile corresponds to the median of the population. Percentiles are often
17 used to estimate the extremes of a distribution. For example, the 90th (10th) percentile may be used to refer
18 to the threshold for the upper (lower) extremes.

19
20 **Permafrost** Ground (soil or rock, and included ice and organic material) that remains at or below 0°C for
21 at least two consecutive years (Harris et al., 1988). Note that permafrost is defined via temperature rather
22 than ice content and, in some instances, may be ice-free.

23
24 *Near-surface permafrost* Permafrost within ~3-4 m of the ground surface. The depth is not precise, but
25 describes what commonly is highly relevant for people and *ecosystems*. Deeper permafrost is often
26 progressively less ice-rich and responds more slowly to warming than near-surface permafrost. Presence or
27 absence of near-surface permafrost is not the only significant metric of permafrost change, and deeper
28 permafrost may persist when near-surface permafrost is absent.

29
30 *Permafrost degradation* Decrease in the thickness and/or areal extent of permafrost.

31
32 *Permafrost thaw* Progressive loss of ground ice in permafrost, usually due to input of heat. Thaw can occur
33 over decades to centuries over the entire depth of permafrost ground, with impacts occurring while thaw
34 progresses. During thaw, temperature fluctuations are subdued because energy is transferred by phase
35 change between ice and water. After the transition from permafrost to non-permafrost, ground can be
36 described as thawed.

37
38 **Perturbed parameter ensemble** See *Model ensemble*.

39
40 **pH** A dimensionless measure of the acidity of a solution given by its concentration of hydrogen ions (H⁺).
41 pH is measured on a logarithmic scale where pH = -log₁₀(H⁺). Thus, a pH decrease of 1 unit corresponds to a
42 10-fold increase in the concentration of H⁺, or acidity.

43
44 **Phenology** The relationship between biological phenomena that recur periodically (e.g., development
45 stages, migration) and *climate* and seasonal changes.

46
47 **Photosynthesis** The production of carbohydrates in plants, algae and some bacteria using the energy of
48 light. Carbon dioxide (CO₂) is used as the carbon source.

49
50 **Physical climate storyline** See *Storyline*.

51
52 **Piacenzian warm period** See *Pliocene*.

53
54 **Plankton** Microorganisms living in the upper layers of aquatic systems. A distinction is made between
55 phytoplankton, which depend on *photosynthesis* for their energy supply, and zooplankton, which feed on

1 phytoplankton.

2
3 **Plant evaporative stress** Plant evaporative stress in both crops and natural vegetation can result from the
4 combination of a high atmospheric evaporative demand and limited available water to supply this demand by
5 means of evapotranspiration, further enhancing *agricultural or ecological drought*.

6
7 **Pleistocene** The Pleistocene Epoch is the earlier of two epochs in the *Quaternary* System, extending from
8 2.59 Ma to the beginning of the *Holocene* at 11.65 ka.

9
10 **Pliocene** The Pliocene Epoch is the more recent of two epochs of the Neogene Period within the *Cenozoic*
11 *Era*. It extends from 5.33 Ma to the beginning of the *Pleistocene* Epoch at 2.59 Ma. The Neogene Period
12 precedes the current geological period, the *Quaternary* Period, which is one of several ice ages that have
13 occurred during Earth's geological history. It encompasses the mid-Pliocene warm period (MPWP), also
14 known as the Piacenzian warm period, which occurred approximately 3.3 to 3.0 Ma. The MPWP, in turn,
15 encompasses the interglacial episode, marine isotope stage (MIS) KM5c, which peaked at 3.205 Ma, when
16 orbital forcing was similar to modern (Haywood et al., 2016).

17
18 **Polar amplification** Polar amplification describes the phenomenon where surface temperature change at
19 high latitudes exceeds the global average surface temperature change. The terms Arctic Amplification or
20 Antarctic Amplification are used when describing the phenomenon occurring at one of the poles.

21
22 **Pollen analysis** A technique of both relative dating and environmental *reconstruction*, consisting of the
23 identification and counting of pollen types preserved in peat, lake sediments and other deposits.

24
25 **Post-glacial period** See *Holocene*.

26
27 **Potential evapotranspiration** See *Evapotranspiration*.

28
29 **Pre-industrial (period)** The multi-century period prior to the onset of large-scale industrial activity around
30 1750. The *reference period* 1850–1900 is used to approximate pre-industrial *global mean surface*
31 *temperature (GMST)*. See also *Industrial revolution*.

32
33 **Precipitable water** The total amount of atmospheric water vapour in a vertical column of unit cross-
34 sectional area. It is commonly expressed in terms of the height of the water if completely condensed and
35 collected in a vessel of the same unit cross section.

36
37 **Precursors** Atmospheric compounds that are not *greenhouse gases (GHGs)* or *aerosols*, but that have an
38 effect on GHG or aerosol concentrations by taking part in physical or chemical processes regulating their
39 production or destruction rates.

40
41 **Predictability** The extent to which future states of a system may be predicted based on knowledge of
42 current and past states of the system. Because knowledge of the climate system's past and current states is
43 generally imperfect, as are the models that utilize this knowledge to produce a *climate prediction*, and
44 because the *climate system* is inherently nonlinear and chaotic, predictability of the climate system is
45 inherently limited. Even with arbitrarily accurate models and observations, there may still be limits to the
46 predictability of such a nonlinear system (AMS, 2021).

47
48 **Prediction quality/skill** Measures of the success of a prediction against observationally based information.
49 No single measure can summarize all aspects of forecast quality and a suite of *metrics* is considered. Metrics
50 will differ for forecasts given in deterministic and probabilistic form.

51
52 **Primary production** The synthesis of organic compounds by plants and microbes, on land or in the ocean,
53 primarily by photosynthesis using light and carbon dioxide (CO₂) as sources of energy and carbon
54 respectively. It can also occur through chemosynthesis, using chemical energy, e.g., in deep sea vents.

1 **Gross Primary Production (GPP)** The total amount of carbon fixed by photosynthesis over a specified
2 time period.

3
4 **Net primary production (NPP)** The amount of carbon fixed by photosynthesis minus the amount lost by
5 respiration over a specified time period.

6
7 **Probability density function (PDF)** A probability density function is a function that indicates the relative
8 chances of occurrence of different outcomes of a variable. The function integrates to unity over the domain
9 for which it is defined and has the property that the integral over a sub-domain equals the probability that the
10 outcome of the variable lies within that sub-domain. For example, the probability that a temperature anomaly
11 defined in a particular way is greater than zero is obtained from its PDF by integrating the PDF over all
12 possible temperature anomalies greater than zero. Probability density functions that describe two or more
13 variables simultaneously are similarly defined.

14
15 **Process-based model** Theoretical concepts and computational methods that represent and simulate the
16 behaviour of real-world systems derived from a set of functional components and their interactions with each
17 other and the system environment, through physical and mechanistic processes occurring over time.

18
19 **Projection** A potential future evolution of a quantity or set of quantities, often computed with the aid of a
20 model. Unlike predictions, projections are conditional on assumptions concerning, for example, future socio-
21 economic and technological developments that may or may not be realised. See also *Climate projection*,
22 *Pathways* and *Scenario*.

23
24 **Proxy** A *proxy climate indicator* is any biophysical property of materials formed during the past that is
25 interpreted to represent some combination of climate-related variations back in time. Climate-related data
26 derived in this way are referred to as proxy data and time series of proxy data are proxy records. Examples of
27 proxy types include pollen assemblages, *tree ring* widths, speleothem and coral geochemistry, and various
28 data derived from marine sediments and glacier ice. Proxy data can be calibrated to provide quantitative
29 climate information.

30
31 **Proxy records** See *Proxy*.

32
33 **Quasi-Biennial Oscillation (QBO)** A near-periodic oscillation of the equatorial zonal wind between
34 easterlies and westerlies in the tropical *stratosphere* with a mean period of around 28 months. The
35 alternating wind maxima descend from the base of the mesosphere down to the *tropopause*, and are driven
36 by wave energy that propagates up from the *troposphere*.

37
38 **Quaternary** The Quaternary Period is the last of three periods that make up the Cenozoic Era (66 Ma to
39 present), extending from 2.58 Ma to the present, and includes the *Pleistocene* and *Holocene* Epochs.

40
41 **Radiative effect** The impact on a radiation flux or heating rate (most commonly, on the downward flux at
42 the top of *atmosphere*) caused by the interaction of a particular constituent with either the *infrared* or *solar*
43 *radiation* fields through absorption, scattering and emission, relative to an otherwise identical *atmosphere*
44 free of that constituent. This quantifies the impact of the constituent on the *climate system*. Examples include
45 the *aerosol-radiation interactions*, *cloud radiative effect*, and *greenhouse effect*. In this report, the portion of
46 any top-of-atmosphere radiative effect that is due to *anthropogenic* or other external influences (e.g.,
47 volcanic eruptions or changes in the sun) is termed the instantaneous *radiative forcing*.

48
49 **Radiative forcing** The change in the net, downward minus upward, radiative flux (expressed in W m^{-2})
50 due to a change in an external *driver of climate change*, such as a change in the concentration of *carbon*
51 *dioxide* (CO_2), the concentration of volcanic *aerosols* or in the output of the Sun. The stratospherically
52 adjusted radiative forcing is computed with all tropospheric properties held fixed at their unperturbed values,
53 and after allowing for stratospheric temperatures, if perturbed, to readjust to radiative-dynamical
54 equilibrium. Radiative forcing is called instantaneous if no change in stratospheric temperature is accounted
55 for. The radiative forcing once both stratospheric and tropospheric adjustments are accounted for is termed

1 the effective radiative forcing.

2
3 **Rapid adjustment** The response to an agent perturbing the *climate system* that is driven directly by the
4 agent, independently of any change in the *global mean surface temperature*. For example, *carbon dioxide*
5 and *aerosols*, by altering internal heating and cooling rates within the *atmosphere*, can each cause changes to
6 cloud cover and other variables thereby producing a *radiative effect* even in the absence of any surface
7 warming or cooling. Adjustments are rapid in the sense that they begin to occur right away, before *climate*
8 *feedbacks* which are driven by warming (although some adjustments may still take significant time to
9 proceed to completion, for example those involving vegetation or *ice sheets*). It is also called the rapid
10 response or fast adjustment.

11
12 **Rapid climate change** See *Abrupt change / abrupt climate change*.

13
14 **Rapid dynamical change (of glaciers or ice sheets)** Changes in *glacier* or *ice sheet* mass controlled by
15 changes in flow speed and discharge rather than by *accumulation* or ablation. This can result in a rate of
16 mass change larger than that due to any imbalance between accumulation and ablation. Rapid dynamical
17 change may be initiated by a climatic trigger, such as incursion of warm ocean water beneath an *ice shelf*, or
18 thinning of a grounded tidewater terminus, which may lead to reactions within the glacier system, that may
19 result in rapid ice loss.

20
21 **Reanalysis** Reanalyses are created by processing past meteorological or oceanographic data using fixed
22 state-of-the-art weather forecasting or ocean circulation models with *data assimilation* techniques. They are
23 used to provide estimates of variables such as historical atmospheric temperature and wind or oceanographic
24 temperature and currents, and other quantities. Using fixed data assimilation avoids effects from the
25 changing analysis system that occur in operational analyses. Although continuity is improved, global
26 reanalyses still suffer from changing coverage and biases in the observing systems.

27
28 **Reasons for concern (RFCs)** Elements of a classification framework, first developed in the IPCC Third
29 Assessment Report, which aims to facilitate judgments about what level of climate change may be dangerous
30 (in the language of Article 2 of the UNFCCC) by aggregating risks from various sectors, considering
31 hazards, exposures, vulnerabilities, capacities to adapt, and the resulting impacts.

32
33 **Reconstruction (of climate variable)** Approach to reconstructing the past temporal and spatial
34 characteristics of a *climate variable* from predictors. The predictors can be instrumental data if the
35 reconstruction is used to infill missing data or *proxy* data if it is used to develop *paleoclimate*
36 reconstructions. Various techniques have been developed for this purpose: linear multivariate regression
37 based methods and nonlinear *Bayesian* and analogue methods.

38
39 **Reference period** The period relative to which *anomalies* are computed. See also *Baseline/reference*
40 *(period)*.

41
42 *Baseline period* The period relative to which *anomalies* are computed. See also *Baseline/reference*
43 *(period)*.

44
45 **Reference scenario** See *Scenario*.

46
47 **Reforestation** Conversion to forest of land that has previously contained forests but that has been
48 converted to some other use. [Note: For a discussion of the term forest and related terms such as
49 afforestation, reforestation and deforestation, see the 2006 IPCC Guidelines for National Greenhouse Gas
50 Inventories and their 2019 Refinement, and information provided by the United Nations Framework
51 Convention on Climate Change (IPCC, 2006, 2019, UNFCCC, 2021a, 2021b).] See also *Afforestation*,
52 *Deforestation*, *Reducing Emissions from Deforestation and Forest Degradation (REDD+)*, *Anthropogenic*
53 *removals* and *Carbon dioxide removal (CDR)*.

54
55 **Region** *Land* and/or *ocean* area characterised by specific geographical and/or climatological features. The

1 *climate* of a region emerges from a multiscale combination of its own features, remote influences from other
2 regions, and global climate conditions.

3
4 **Regional climate messages** Regional climate messages translate *climate information* synthesized from
5 different lines of *evidence* into the context of a user *vulnerable* to climate at regional scales taking into
6 account the values of both the producer and user (WGI Section 10.5).

7
8 **Regional climate model (RCM)** A *climate model* at higher *resolution* over a limited area. Such models
9 are used in *downscaling* global *climate* results over specific regional domains.

10
11 **Regional climate scenario** A narrative used to describe how the future might unfold for a region (IPCC-
12 TGICA, 2007). These are often used to guide impact understanding and adaptation efforts. They can include
13 quantitative information based on scaled historical data or derived from GCM-based internally consistent
14 future climates. See also *Climate scenario*.

15
16 **Regional sea level change** See *Sea level change (sea level rise/sea level fall)*.

17
18 **Relative humidity** The relative humidity specifies the ratio of actual water vapour pressure to that at
19 saturation with respect to liquid water or ice at the same temperature. See also *Specific humidity*.

20
21 **Relative sea-level (RSL) change** See *Sea level change (sea level rise/sea level fall)*.

22
23 **Remaining carbon budget** See *Carbon budget*.

24
25 **Representative concentration pathways (RCPs)** See *Pathways*.

26
27 **Reservoir** A component or components of the climate system where a *greenhouse gas (GHG)* or a
28 *precursor* of a greenhouse gas is stored (UNFCCC Article 1.7 (UNFCCC, 1992)).

29
30 **Resilience** The capacity of interconnected social, economic and ecological systems to cope with a
31 hazardous event, trend or disturbance, responding or reorganising in ways that maintain their essential
32 function, identity and structure. Resilience is a positive attribute when it maintains capacity for adaptation,
33 learning and/or transformation (Arctic Council, 2016). See also *Hazard, Risk* and *Vulnerability*.

34
35 **Resolution** In *climate models*, this term refers to the physical distance (metres or degrees) between each
36 point on the grid used to compute the equations. Temporal resolution refers to the time step or time elapsed
37 between each model computation of the equations.

38
39 **Respiration** The process whereby living organisms convert organic matter to *carbon dioxide (CO₂)*,
40 releasing energy and consuming molecular oxygen.

41
42 **Response time or adjustment time** In the context of climate variations, the response time or adjustment
43 time is the time needed for the *climate system* or its components to re-equilibrate to a new state, following a
44 forcing resulting from external processes. It is very different for various components of the climate system.
45 The response time of the *troposphere* is relatively short, from days to weeks, whereas the *stratosphere*
46 reaches equilibrium on a time scale of typically a few months. Due to their large heat capacity, the oceans
47 have a much longer response time: typically decades, but up to centuries or millennia. The response time of
48 the strongly coupled surface-troposphere system is, therefore, slow compared to that of the stratosphere, and
49 mainly determined by the oceans. The *biosphere* may respond quickly (e.g., to *droughts*), but also very
50 slowly to imposed changes.

51
52 In the context of *lifetimes*, response time or adjustment time (T_a) is the time scale characterizing the decay of
53 an instantaneous pulse input into the *reservoir*. See *Response time or adjustment time (Ta)* under *Lifetime*.

54
55 **Return period** An estimate of the average time interval between occurrences of an event (e.g., flood or

1 extreme rainfall) of (or below/above) a defined size or intensity.

2
3 **Return value** The highest (or, alternatively, lowest) value of a given variable, on average occurring once
4 in a given period of time (e.g., in 10 years).

5
6 **Risk** The potential for adverse consequences for human or ecological systems, recognising the diversity of
7 values and objectives associated with such systems. In the context of *climate change*, risks can arise from
8 potential *impacts* of climate change as well as human responses to climate change. Relevant adverse
9 consequences include those on lives, *livelihoods*, health and *well-being*, economic, social and cultural assets
10 and investments, infrastructure, services (including *ecosystem services*), *ecosystems* and species.

11
12 In the context of climate change impacts, risks result from dynamic interactions between climate-related
13 *hazards* with the *exposure* and *vulnerability* of the affected human or ecological system to the hazards.
14 Hazards, exposure and vulnerability may each be subject to uncertainty in terms of magnitude and *likelihood*
15 of occurrence, and each may change over time and space due to socio-economic changes and human
16 decision-making (see also *risk management*, *adaptation* and *mitigation*).

17
18 In the context of climate change responses, risks result from the potential for such responses not achieving
19 the intended objective(s), or from potential trade-offs with, or negative side-effects on, other societal
20 objectives, such as the *Sustainable Development Goals (SDGs)* (see also *risk trade-off*). Risks can arise for
21 example from uncertainty in implementation, effectiveness or outcomes of *climate policy*, climate-related
22 investments, technology development or adoption, and system transitions. See also *Hazard* and *Impacts*
23 (*consequences*, *outcomes*).

24
25 **Risk assessment** The qualitative and/or quantitative scientific estimation of *risks*. See also *Risk*
26 *management* and *Risk perception*.

27
28 **Risk framework** A common framework for describing and assessing risk across all three working groups
29 is adopted to promote clear and consistent communication of risks and to better inform risk assessment and
30 decision making related to climate change.

31
32 **Risk management** Plans, actions, strategies or policies to reduce the *likelihood* and/or magnitude of
33 adverse potential consequences, based on assessed or perceived *risks*. See also *Risk assessment*, *Risk*
34 *perception* and *Risk transfer*.

35
36 **Risk perception** The subjective judgment that people make about the characteristics and severity of a *risk*.
37 See also *Risk assessment*, *Risk management* and *Risk transfer*.

38
39 **Risk trade-off** The change in the portfolio of *risks* that occurs when a countervailing risk is generated
40 (knowingly or inadvertently) by an intervention to reduce the target risk (Wiener and Graham, 2009).

41
42 **River discharge** See *Streamflow*.

43
44 **Rock glacier** A debris landform (mass of rock fragments and finer material that contains either an ice core
45 or an ice-cemented matrix) generated by a former or current gravity-driven creep of *permafrost* in mountain
46 slopes (Harris et al., 1988; Giardino et al., 2011; IPA-RG, 2020). It is detectable in the landscape due to the
47 occurrence of (1) a steep slope delimiting the terminal part; (2) generally well-defined lateral margins in a
48 continuation of the front; (3) transversal or longitudinal ridges and furrows (ridge and furrow topography).
49 These are geomorphological indicators of the occurrence of permafrost conditions. Although it is an ice
50 storage feature, it is not a type of glacier since it is not originated over the surface by the recrystallization of
51 snow.

52
53 **Runoff** The flow of water over the surface or through the subsurface, which typically originates from the
54 part of liquid precipitation and/or snow/ice melt that does not evaporate, transpire or refreeze, and returns to
55 water bodies.

1 **Sampling uncertainty** See *Uncertainty*.

2
3 **Scenario** A plausible description of how the future may develop based on a coherent and internally
4 consistent set of assumptions about key driving forces (e.g., rate of technological change (TC), prices) and
5 relationships. Note that scenarios are neither predictions nor forecasts, but are used to provide a view of the
6 implications of developments and actions. See also *Climate scenario* and *Regional climate scenario*.

7
8 *Baseline scenario* See Reference Scenario See *Reference scenario* (under *Scenario*).

9
10 *Concentrations scenario* A plausible representation of the future development of atmospheric
11 concentrations of substances that are radiatively active (e.g., *greenhouse gases (GHGs)*, *aerosols*,
12 *tropospheric ozone*), plus human-induced *land cover changes* that can be radiatively active via *albedo*
13 changes, and often used as input to a *climate model* to compute *climate projections*.

14
15 *Emissions scenario* A plausible representation of the future development of emissions of substances that
16 are radiatively active (e.g., *greenhouse gases (GHGs)* or *aerosols*), plus human-induced land cover changes
17 that can be radiatively active via albedo changes, based on a coherent and internally consistent set of
18 assumptions about driving forces (such as demographic and socio-economic development, technological
19 change, energy and *land use*) and their key relationships. *Concentration scenarios*, derived from emission
20 scenarios, are often used as input to a *climate model* to compute *climate projections*. See also *Representative*
21 *concentration pathways (RCPs)* (under *Pathways*) and *Shared socio-economic pathways (SSPs)* (under
22 *Pathways*).

23
24 *Mitigation scenario* A plausible description of the future that describes how the (studied) system responds
25 to the implementation of *mitigation* policies and measures. See also *Pathways*, *Socio-economic scenario*
26 (under *Scenario*) and *Stabilisation (of GHG or CO₂-equivalent concentration)*.

27
28 *Reference scenario* Scenario used as starting or reference point for a comparison between two or more
29 scenarios.

30
31 [Note 1: In many types of climate change research, reference scenarios reflect specific assumptions about
32 patterns of socio-economic development and may represent futures that assume no climate policies or
33 specified climate policies, for example those in place or planned at the time a study is carried out. Reference
34 scenarios may also represent futures with limited or no climate impacts or adaptation, to serve as a point of
35 comparison for futures with impacts and adaptation. These are also referred to as baseline scenarios in the
36 literature.

37
38 Note 2: Reference scenarios can also be climate policy or impact scenarios, which in that case are taken as a
39 point of comparison to explore the implications of other features, e.g., of delay, technological options, policy
40 design and strategy or to explore the effects of additional impacts and adaptation beyond those represented in
41 the reference scenario.

42
43 Note 3: The term business as usual scenario has been used to describe a scenario that assumes no additional
44 policies beyond those currently in place and that patterns of socio-economic development are consistent with
45 recent trends. The term is now used less frequently than in the past.

46
47 Note 4: In climate change attribution or impact attribution research reference scenarios may refer to
48 counterfactual historical scenarios assuming no anthropogenic greenhouse gas emissions (climate change
49 attribution) or no climate change (impact attribution).]

50
51 *Socio-economic scenario* A scenario that describes a plausible future in terms of population, *gross*
52 *domestic product (GDP)*, and other socio-economic factors relevant to understanding the implications of
53 *climate change*. See also *Baseline scenario* (under *Scenario*), *Mitigation scenario* (under *Scenario*) and
54 *Pathways*.

1 **Scenario storyline** See *Storyline*.

2
3 **Sea ice** Ice found at the sea surface that has originated from the freezing of seawater. Sea ice may be
4 discontinuous pieces (ice floes) moved on the *ocean* surface by wind and currents (pack ice), or a motionless
5 sheet attached to the *coast* (land-fast ice). Sea ice concentration is the fraction of the ocean covered by ice.
6 Sea ice less than one year old is called first-year ice. Perennial ice is sea ice that survives at least one
7 summer. It may be subdivided into second-year ice and multi-year ice, where multiyear ice has survived at
8 least two summers.

9
10 **Sea ice area (SIA)** Sea ice area is the area covered by sea ice. In contrast to *sea ice extent*, it is a linear
11 measure of sea ice coverage that does not depend on grid resolution.

12
13 **Sea ice concentration** Sea ice concentration is the fraction of the ocean covered by ice.

14
15 **Sea ice extent (SIE)** Sea ice extent is calculated for gridded data products as the total area of all grid cells
16 with *sea ice concentration* above a given threshold, usually 15 %. It hence is a grid-dependent, non-linear
17 measure of sea ice coverage.

18
19 **Sea level change (sea level rise/sea level fall)** Change to the height of sea level, both globally and locally
20 (*relative sea level change*) at seasonal, annual, or longer time scales due to (1) a change in *ocean* volume as a
21 result of a change in the mass of water in the ocean (e.g., due to melt of *glaciers* and *ice sheets*), (2) changes
22 in ocean volume as a result of changes in ocean water density (e.g., expansion under warmer conditions), (3)
23 changes in the shape of the ocean basins and changes in the Earth's gravitational and rotational fields, and
24 (4) local subsidence or uplift of the *land*. *Global mean sea level change* resulting from change in the mass of
25 the ocean is called barystatic. The amount of barystatic sea level change due to the addition or removal of a
26 mass of water is called its *sea level equivalent (SLE)*. Sea level changes, both globally and locally, resulting
27 from changes in water density are called steric. Density changes induced by temperature changes only are
28 called thermosteric, while density changes induced by salinity changes are called halosteric. Barystatic and
29 steric sea level changes do not include the effect of changes in the shape of ocean basins induced by the
30 change in the ocean mass and its distribution. See also *Vertical land motion (VLM)*, *Land water storage*, *Sea*
31 *level commitment*, *Glacial isostatic adjustment (GIA)*, *Extreme sea level (ESL)* and *Storm surge*.

32
33 **Geocentric sea-level change** The change in local mean sea surface height with respect to the terrestrial
34 reference frame, it is the sea-level change observed with instruments from space. See also *Altimetry*.

35
36 **Global mean sea-level (GMSL) change** The increase or decrease in the volume of the ocean divided by the
37 ocean surface area. It is the sum of changes in ocean density through temperature changes (global mean
38 *thermosteric sea-level change*) and changes in the ocean mass as a result of changes in the cryosphere or
39 land water storage (barystatic sea-level change). See also *Terrestrial water storage (TWS)*.

40
41 **Gravitational, rotational and deformational (GRD) effects** Changes in Earth Gravity, Earth Rotation and
42 viscoelastic solid Earth Deformation (GRD) result from the redistribution of mass between terrestrial ice and
43 water reservoirs and the ocean. Contemporary terrestrial mass loss leads to elastic solid Earth uplift and a
44 nearby relative sea-level fall (for a single source of terrestrial mass loss this is within ~2000 km, for multiple
45 sources the distance depends on the interaction of the different relative sea-level patterns). Farther away
46 (more than ~7000 km for a single source of terrestrial mass loss), relative sea level rises more than the global
47 average, due, to first order, to gravitational effects. Earth deformation associated with adding water to the
48 oceans and a shift of the Earth's rotation axis towards the source of terrestrial mass loss leads to second-
49 order effects that increase spatial variability of the pattern globally. GRD effects due to the redistribution of
50 ocean water within the ocean itself are referred to as self-attraction and loading effects.

51
52 **Halosteric sea-level change** Halosteric sea-level change occurs as a result of salinity variations: higher
53 salinity leads to higher density and decreases the volume per unit of mass. Although both processes can be
54 relevant on regional to local scales, only thermosteric changes impact the *global mean sea-level change*,
55 whereas the global mean halosteric change is negligible (Gregory et al., 2019).

- 1
2 **Local sea level change** Change in sea level relative to a datum (such as present-day mean sea level) at
3 spatial scales smaller than 10 km.
4
- 5 **Ocean dynamic sea level change** Change in mean sea level relative to the geoid associated with circulation
6 and density-driven changes in the ocean. Ocean dynamic sea-level change is regionally varying but by
7 definition has a zero global mean and conventionally is inverse-barometer corrected (i.e., the effect of the
8 hydrostatic depression of the sea surface by atmospheric pressure changes is removed). Changes in ocean
9 currents occur due to variations in heating and cooling, variability in winds and changes in seasonally- to
10 annually-averaged air temperature and humidity.
11
- 12 **Regional sea level change** Change in sea level relative to a datum (such as present-day *mean sea level*) at
13 spatial scales of about 100 km.
14
- 15 **Relative sea-level (RSL) change** The change in local mean *sea surface height (SSH)* relative to the local
16 solid surface, i.e. the sea floor, as measured by instruments that are fixed to the Earth's surface, such as *tide*
17 *gauges*. This reference frame is used when considering coastal *impacts, hazards* and *adaptation* needs.
18
- 19 **Steric sea level change** Steric sea-level change is caused by changes in the ocean density and is composed
20 of *thermosteric sea-level change* and *halosteric sea-level change*.
21
- 22 **Thermosteric sea-level change** Thermosteric sea-level change (where thermosteric sea-level rise may also
23 be referred to as thermal expansion) occurs as a result of changes in ocean temperature: increasing
24 temperature reduces ocean density and increases the volume per unit of mass.
25
- 26 **Sea level equivalent (SLE)** The SLE of a mass of water, ice, or water vapour is that mass, converted to a
27 volume using a density of 1000 kg m⁻³, and divided by the present-day *ocean* surface area of 3.625 × 1000
28 m². Thus, 362.5 Gt of water mass added to the ocean correspond to 1 mm of global mean sea level rise.
29 However, more accurate estimates of SLE must account for additional processes affecting mean sea level
30 rise, such as shoreline migration, changes in ocean area, and for vertical land movements.
31
- 32 **Sea level rise (SLR)** See *Sea level change (sea level rise/sea level fall)*.
33
- 34 **Sea surface temperature (SST)** The subsurface bulk temperature in the top few metres of the ocean,
35 measured by ships, buoys, and drifters. From ships, measurements of water samples in buckets were mostly
36 switched in the 1940s to samples from engine intake water. Satellite measurements of skin temperature
37 (uppermost layer; a fraction of a millimetre thick) in the infrared or the top centimetre or so in the
38 microwave are also used, but must be adjusted to be compatible with the bulk temperature.
39
- 40 **Semi-direct (aerosol) effect** See *Aerosol-radiation interaction*.
41
- 42 **Semi-empirical model** Model in which calculations are based on a combination of observed associations
43 between variables and theoretical considerations relating variables through fundamental principles (e.g.,
44 conservation of energy). For example, in sea level studies, semi-empirical models refer specifically to
45 transfer functions formulated to project future *global mean sea level change*, or contributions to it, from
46 future *global mean surface temperature* change or *radiative forcing*.
47
- 48 **Sensible heat flux** The turbulent or conductive flux of heat from the Earth's surface to the *atmosphere* that
49 is not associated with phase changes of water; a component of the surface *energy budget*.
50
- 51 **Sequestration** The process of storing carbon in a carbon pool. See also *Uptake* and *Soil carbon*
52 *sequestration (SCS)*.
53
- 54 **Sequestration potential** The quantity of greenhouse gases that can be removed from the atmosphere by
55 anthropogenic enhancement of sinks and stored in a pool. See Mitigation potential for different subcategories

1 of sequestration potential. See also *Pool, carbon and nitrogen, Sequestration* and *Sink*.

2
3 **Shared policy assumptions (SPAs)** See *Shared socio-economic pathways (SSPs)* (under *Pathways*).

4
5 **Shared socio-economic pathways (SSPs)** See *Pathways*.

6
7 **Short-lived climate forcers (SLCFs)** A set of chemically reactive compounds with short (relative to CO₂)
8 atmospheric lifetimes (from hours to decades) but characterised by different physiochemical properties and
9 environmental effects. Their emission or formation has a significant effect on radiative forcing over a period
10 determined by their respective atmospheric *lifetimes*. Changes in their *emissions* can also induce long-term
11 *climate* effects via, in particular, their interactions with some biogeochemical cycles. SLCFs are classified as
12 direct or indirect, with direct SLCFs exerting climate effects through their *radiative forcing* and indirect
13 SLCFs being the *precursors* of other direct climate forcers. Direct SLCFs include *methane (CH₄)*, *ozone*
14 (*O₃*), primary *aerosols* and some halogenated species. Indirect SLCFs are precursors of ozone or secondary
15 aerosols. SLCFs can be cooling or warming through interactions with radiation and clouds. They are also
16 referred to as near-term climate forcers (NTCFs). Many SLCFs are also air pollutants. A subset of
17 exclusively warming SLCFs is also referred to as short-lived climate pollutants (SLCPs), including methane,
18 ozone, and black carbon.

19
20 **Short-lived climate pollutants (SLCP)** See *Short-lived climate forcers (SLCFs)*.

21
22 **Shortwave radiation** See *Solar radiation*.

23
24 **Significant wave height** The average trough-to-crest height of the highest one-third of the wave heights
25 (sea and swell) occurring in a particular time period.

26
27 **Simple climate model (SCM)** A broad class of lower-dimensional models of the *energy balance*, radiative
28 transfer, *carbon cycle*, or a combination of such physical components. SCMs are also suitable for performing
29 *emulations* of climate-mean variables of *Earth system models (ESMs)*, given that their structural flexibility
30 can capture both the parametric and structural uncertainties across process-oriented ESM responses. They
31 can also be used to test consistency across multiple lines of evidence with regard to *climate sensitivity*
32 ranges, *transient climate responses (TCRs)*, *transient climate response to cumulative emissions (TCREs)* and
33 carbon cycle *feedbacks*. See also *Emulators* and *Earth system model of intermediate complexity (EMIC)*.

34
35 **Sink** Any process, activity or mechanism which removes a greenhouse gas, an aerosol or a precursor of a
36 greenhouse gas from the atmosphere (UNFCCC Article 1.8 (UNFCCC, 1992)). See also *Source* and *Uptake*.

37
38 **Small Island Developing States (SIDS)** Small Island Developing States (SIDS), as recognised by the
39 United Nations OHRLLS (Office of the High Representative for the Least Developed Countries, Landlocked
40 Developing Countries and Small Island Developing States), are a distinct group of developing countries
41 facing specific social, economic and environmental vulnerabilities (UN-OHRLLS, 2011). They were
42 recognized as a special case both for their environment and development at the Rio Earth Summit in Brazil
43 in 1992. Fifty-eight countries and territories are presently classified as SIDS by the UN OHRLLS, with 38
44 being UN member states and 20 being Non-UN Members or Associate Members of the Regional
45 Commissions (UN-OHRLLS, 2018).

46
47 **Snow cover** Snow cover refers to all the snow that has accumulated on the ground at a given time
48 (UNESCO/IASH/WMO, 1970).

49
50 **Snow cover duration (SCD)** How long snow continuously remains on the land surface, or the period
51 between snow-on and snow-off dates.

52
53 **Snow cover extent (SCE)** The areal extent of snow covered ground.

54
55 **Snow water equivalent (SWE)** The depth of liquid water that would result if a mass of snow melted

1 completely.

2
3 **Socio-economic scenario** See *Scenario*.

4
5 **Soil moisture** Water stored in the soil in liquid or frozen form. Root-zone soil moisture is of most
6 relevance for plant activity.

7
8 **Soil temperature** The temperature of the soil. This can be measured or modelled at multiple levels within
9 the depth of the soil.

10
11 **Solar activity** General term collectively describing a variety of magnetic phenomena on the Sun such as
12 *sunspots, faculae* (bright areas), and flares (emission of high-energy particles). It varies on time scales from
13 minutes to millions of years. The *solar cycle*, with an average duration of 11 years, is an example of a quasi-
14 regular change in solar activity.

15
16 **Solar cycle (11-year)** A quasi-regular modulation of *solar activity* with varying amplitude and a period of
17 between 8 and 14 years.

18
19 **Solar radiation** Electromagnetic radiation emitted by the Sun with a spectrum close to the one of a black
20 body with a temperature of 5770 K. The radiation peaks in visible wavelengths. When compared to the
21 *terrestrial radiation* it is often referred to as shortwave radiation. See also *Insolation* and *Total solar*
22 *irradiance (TSI)*.

23
24 **Solar radiation modification (SRM)** Solar radiation modification (SRM) refers to a range of radiation
25 modification measures not related to greenhouse gas (GHG) mitigation that seek to limit global warming.
26 Most methods involve reducing the amount of incoming solar radiation reaching the surface, but others also
27 act on the longwave radiation budget by reducing optical thickness and cloud lifetime.

28
29 *Cirrus cloud thinning (CCT)* Cirrus cloud thinning is one of several radiation modification approaches to
30 counter the warming caused by greenhouse gases. In the approach, it is proposed to reduce the amount of
31 cirrus clouds by injecting ice nucleating substances in the upper troposphere. The reduction in cirrus clouds
32 is expected to increase the amount of longwave cooling to space resulting in a planetary cooling. Although
33 cirrus cloud thinning primarily affects the longwave radiation budget of our planet, it is often identified as
34 one of the *solar radiation modification (SRM)* approaches in the literature.

35
36 *Marine cloud brightening (MCB)* Marine cloud brightening is one of several solar radiation modification
37 (SRM) approaches to increase the planetary albedo. In the approach, it is proposed to inject sea salt aerosols
38 into the persistent marine lows clouds. This is expected to increase the cloud droplet concentration of these
39 clouds and their reflectivity.

40
41 *Stratospheric aerosol injection (SAI)* Stratospheric aerosol injection is one of several solar radiation
42 modification (SRM) approaches to increase the planetary albedo. In the approach, it is proposed to inject
43 highly reflective aerosols such as sulphates into the lower stratosphere. This is expected to increase the
44 fraction of solar radiation deflected to space resulting in a planetary cooling.

45
46 **Solubility pump** A physicochemical process that transports dissolved inorganic carbon from the *ocean's*
47 surface to its interior. The solubility pump is primarily driven by the solubility of *carbon dioxide (CO₂)* (with
48 more CO₂ dissolving in colder water) and the large-scale, thermohaline patterns of ocean circulation.

49
50 **Source** Any process or activity which releases a greenhouse gas, an aerosol or a precursor of a greenhouse
51 gas into the atmosphere (UNFCCC Article 1.9 (UNFCCC, 1992)). See also *Sink*.

52
53 **South American monsoon (SAmerM)** See *Global monsoon*.

54
55 **South and Southeast Asian monsoon (SAsiaM)** See *Global monsoon*.

55

Southern Annular Mode (SAM) See *Annular modes*.

South Pacific Convergence Zone (SPCZ) A band of low-level convergence, cloudiness and precipitation ranging from the west Pacific warm pool south-eastwards towards French Polynesia, which is one of the most significant features of subtropical Southern Hemisphere *climate*. It shares some characteristics with the *Inter-Tropical Convergence Zone (ITCZ)*, but is more extratropical in nature, especially east of the Dateline.

Southern Oscillation See *El Niño-Southern Oscillation (ENSO)*.

Specific humidity The specific humidity specifies the ratio of the mass of water vapour to the total mass of moist air. See also *Relative humidity*.

Stadial A period of North Atlantic cooling during the last glacial period, lasting anywhere from several centuries to millennia, as inferred from oxygen *isotopes* in Greenland *ice cores*. These episodes are often referred to as examples of “abrupt climate change events”, as they are often terminated by abrupt warming. They occur repeatedly during the last glacial period, and are associated with a distinct pattern of global temperature and hydrological variations recorded in *paleoclimate* records from this interval. See also *Younger Dryas*.

Statistical downscaling See *Downscaling*.

Steric sea level change See *Sea level change (sea level rise/sea level fall)*.

Storm surge The temporary increase, at a particular locality, in the height of the sea due to extreme meteorological conditions (low atmospheric pressure and/or strong winds). The storm surge is defined as being the excess above the level expected from the tidal variation alone at that time and place. See also *Sea level change (sea level rise/sea level fall)* and *Extreme sea level (ESL)*.

Storm tracks Originally, a term referring to the tracks of individual cyclonic weather systems, but now often generalized to refer to the main *regions* where the tracks of extratropical disturbances occur as sequences of low (cyclonic) and high (anticyclonic) pressure systems.

Storyline A way of making sense of a situation or a series of events through the construction of a set of explanatory elements. Usually it is built on logical or causal reasoning. In *climate* research, the term storyline is used both in connection to *scenarios* as related to a future trajectory of the climate and human systems or to a weather or climate event. In this context, storylines can be used to describe plural, conditional possible futures or explanations of a current situation, in contrast to single, definitive futures or explanations.

Physical climate storyline A self-consistent and plausible unfolding of a physical trajectory of the *climate system*, or a weather or climate event, on timescales from hours to multiple decades (Shepherd et al., 2018). Through this, storylines explore, illustrate and communicate uncertainties in the *climate system* response to *forcing* and in *internal variability*.

Scenario storyline A narrative description of a *scenario* (or family of scenarios), highlighting the main scenario characteristics, relationships between key driving forces and the dynamics of their evolution.

Stratification Process of forming of layers of (*ocean*) water with different properties such as salinity, density and temperature that act as barrier for water mixing. The strengthening of near-surface stratification generally results in warmer surface waters, decreased oxygen levels in deeper water, and intensification of *ocean acidification (OA)* in the upper ocean.

Stratosphere The highly stratified region of the atmosphere above the *tropopause*, extending to about 50 km altitude. See also *Troposphere*.

- 1
2 **Stratospheric aerosol injection (SAI)** See *Solar radiation modification (SRM)*.
3
4 **Stratosphere-troposphere exchange (STE)** Stratosphere-troposphere exchange (STE) is understood as
5 the flux of air or trace constituents across the tropopause, including both directions: the stratosphere to
6 troposphere transport (STT) and troposphere to stratosphere transport (TST). STE is one of the key factors
7 controlling the budgets of ozone, water vapour and other substances in both the *troposphere* and the lower
8 *stratosphere*.
9
10 **Stratospheric ozone** Stratospheric ozone describes the *ozone (O₃)* that resides in the *stratosphere*, the
11 region of the *atmosphere* which exists between 10 and 50 kilometres above the surface of the earth. Ninety
12 percent of total-column ozone resides in the stratosphere. See *Ozone layer* and *Ozone (O₃)*. See also *Ozone-*
13 *depleting substances (ODSs)*.
14
15 **Stratospheric polar vortex** A large-scale region of cold air poleward of approximately 60 degrees that is
16 contained by a strong westerly jet from the tropopause (8-10km) to the stratopause (50-60km) and that forms
17 in each hemisphere during the winter half-year. Planetary waves can temporarily disrupt the vortex,
18 producing easterly winds and rapid warming over polar regions in the stratosphere, and leading to substantial
19 weakening or breakdown of the vortex.
20
21 **Stratospheric sounding unit (SSU)** A three-channel infrared sounder on operational NOAA polar-
22 orbiting satellites. The three channels are used to determine profiles of temperature in the *stratosphere*
23 (AMS, 2020).
24
25 **Streamflow** Water flow within a river channel, for example, expressed in m³ s⁻¹. A synonym for river
26 discharge.
27
28 **Subduction** Ocean process in which surface waters enter the ocean interior from the surface mixed layer
29 through *Ekman pumping* and lateral *advection*. The latter occurs when surface waters are advected to a
30 *region* where the local *surface layer* is less dense and therefore must slide below the surface layer, usually
31 with no change in density.
32
33 **Sudden stratospheric warming (SSW)** A phenomena of rapid warming in the *stratosphere* at high
34 latitudes (sometimes more than 50°C in 1-2 days) that can cause breakdown of *stratospheric polar vortices*.
35
36 **Sulphur hexafluoride (SF₆)** One of the seven types of *greenhouse gases (GHGs)* to be mitigated under
37 the Kyoto Protocol. SF₆ is largely used in heavy industry to insulate high-voltage equipment and to assist in
38 the manufacturing of cable-cooling systems and semi-conductors.
39
40 **Sunspots** Dark areas on the Sun where strong magnetic fields reduce the convection causing a temperature
41 reduction of about 1500 K compared to the surrounding regions. The number of sunspots is higher during
42 periods of higher *solar activity*, and varies in particular with the *solar cycle*.
43
44 **Surface air temperature** See *Land surface air temperature (LSAT)* and *Global mean surface air*
45 *temperature (GSAT)*.
46
47 **Surface mass balance (SMB)** See *Mass balance / budget (of glaciers or ice sheets)*.
48
49 **Surface temperature** See *Global mean surface air temperature (GSAT)*, *Global mean surface*
50 *temperature (GMST)*, *Land surface air temperature (LSAT)* and *Sea surface temperature (SST)*.
51
52 **Surprises** A class of risk that can be defined as low-likelihood but well-understood events, and events that
53 cannot be predicted with current understanding (see 1.4.4.3 in AR6 WGI Chapter 1). See also *Unknown*
54 *unknowns*.
55

1 **Swash** See *Extreme sea level (ESL)*.

2
3 **Talik** A layer or body of unfrozen ground in a *permafrost* area due to a local anomaly in thermal,
4 hydrological, hydrogeological or hydrochemical conditions (IPA, 2005).

5
6 **Technical potential** See *Mitigation potential*.

7
8 **Teleconnection** Association between *climate* variables at widely separated, geographically fixed locations
9 related to each other through physical processes and oceanic and/or atmospheric dynamical pathways.
10 Teleconnections can be caused by several climate phenomena, such as Rossby wave-trains, mid-latitude jet
11 and storm track displacements, fluctuations of the *Atlantic Meridional Overturning Circulation*, fluctuations
12 of the Walker circulation, etc. They can be initiated by *modes of climate variability* thus providing the
13 development of remote climate *anomalies* at various temporal lags.

14
15 **Teleconnection pattern** A correlation map obtained by calculating the correlation between variables at
16 different spatial locations and a *climate index*. It is the special case of a *climate pattern* obtained for
17 standardized variables and a standardized climate index, that is, the variables and index are each centred and
18 scaled to have zero mean and unit variance. One-point *teleconnection* maps are made by choosing a variable
19 at one of the locations to be the climate index.

20
21 **Temperature overshoot** Exceedance of a specified global warming level, followed by a decline to or
22 below that level during a specified period of time (e.g., before 2100). Sometimes the magnitude and
23 likelihood of the overshoot is also characterized. The overshoot duration can vary from one *pathway* to the
24 next but in most *overshoot pathways* in the literature and referred to as overshoot pathways in the AR6, the
25 overshoot occurs over a period of at least one and up to several decades. See also *Pathways*.

26
27 **Terrestrial radiation** Radiation emitted by the Earth's surface, the *atmosphere* and the clouds. It is also
28 known as thermal infrared or long-wave radiation, and is to be distinguished from the near-infrared radiation
29 that is part of the solar spectrum. Infrared radiation, in general, has a distinctive range of wavelengths
30 (spectrum) longer than the wavelength of the red light in the visible part of the spectrum. The spectrum of
31 terrestrial radiation is almost entirely distinct from that of shortwave or *solar radiation* because of the
32 difference in temperature between the Sun and the Earth-atmosphere system.

33
34 **Thermal expansion** See *Steric sea level change* (under *Sea level change (sea level rise/sea level fall)*).

35
36 **Thermocline** The layer of maximum vertical temperature gradient in the ocean, lying between the surface
37 ocean and the abyssal ocean. In subtropical regions, its source waters are typically surface waters at higher
38 latitudes that have subducted (see *Subduction*) and moved equatorward. At high latitudes, it is sometimes
39 absent, replaced by a *halocline*, which is a layer of maximum vertical salinity gradient.

40
41 **Thermohaline circulation (THC)** See *Meridional overturning circulation (MOC)*.

42
43 **Thermokarst** Process by which characteristic landforms result from thawing of ice-rich *permafrost* or
44 melting of massive ice (IPA, 2005).

45
46 **Thermosteric** See *Sea level change (sea level rise/sea level fall)*.

47
48 **Tide gauge** A device at a coastal or deep-sea location that continuously measures the level of the sea with
49 respect to the adjacent land. Time averaging of the sea level so recorded gives the observed secular changes
50 of the *relative sea level*.

51
52 **Time of emergence (ToE)** Time when a specific *anthropogenic* signal related to *climate change* is
53 statistically detected to emerge from the background noise of natural *climate variability* in a *reference*
54 *period*, for a specific *region* (Hawkins and Sutton, 2012). See also *Emergence (of the climate signal)*.

1 **Tipping element** A component of the Earth System that is susceptible to a *tipping point*.

2
3 **Tipping point** A critical threshold beyond which a system reorganizes, often abruptly and/or irreversibly.
4 See also *Tipping element*, *Irreversibility* and *Abrupt change*.

5
6 **Total alkalinity** Total Alkalinity (A_T) is a measurable parameter of the seawater acid-base system which,
7 when expressed in micromoles per kilogram of seawater, is a conservative variable both on mixing, and for
8 changes in temperature and/or pressure. Changes in total alkalinity in the oceans can result from a variety of
9 biogeochemical processes that affect the acid-base composition of the seawater itself. However, its value is
10 not affected by the exchange of carbon dioxide gas between seawater and the atmosphere. Measurements of
11 total alkalinity can thus be used to help study these biogeochemical processes, and can also be used to help
12 calculate the state of the seawater acid-base system. Total alkalinity is most commonly measured using an
13 acidimetric titration technique, that determines how much acid is required to titrate a seawater sample to a
14 specified equivalence point.

15
16 **Total carbon budget** See *Carbon budget*.

17
18 **Total solar irradiance (TSI)** The total amount of *solar radiation* in watts per square metre received
19 outside the Earth's *atmosphere* on a surface normal to the incident radiation, and at the Earth's mean distance
20 from the Sun. Reliable measurements of solar radiation can only be made from space and the precise record
21 extends back only to 1978. It has recently been estimated to $1360.8 \pm 0.5 \text{ W m}^{-2}$ for the solar minimum of
22 2008. Variations of a few tenths of a percent are common, usually associated with the passage of *sunspots*
23 across the solar disk. The *solar cycle* variation of TSI is of the order of 0.1% (AMS, 2000). See also
24 *Insolation*.

25
26 **Total water level** See *Extreme sea level (ESL)*.

27
28 **Trace gas** A minor constituent of the *atmosphere*, next to nitrogen and oxygen that together make up 99 %
29 of all volume. The most important trace gases contributing to the *greenhouse effect* are *carbon dioxide*
30 (CO_2), *ozone* (O_3), *methane* (CH_4), *nitrous oxide* (N_2O), perfluorocarbons (PFCs), *chlorofluorocarbons*
31 (*CFCs*), hydrofluorocarbons (HFCs), *sulphur hexafluoride* (SF_6) and water vapour (H_2O).

32
33 **Transient climate response (TCR)** See *Climate sensitivity*.

34
35 **Transient climate response to cumulative CO2 emissions (TCRE)** See *Climate sensitivity*.

36
37 **Tree rings** Concentric rings of secondary wood evident in a cross section of the stem of a woody plant.
38 The difference between the dense, small-celled late wood of one season and the wide-celled early wood of
39 the following spring enables the age of a tree to be estimated, and the ring widths or density can be related to
40 *climate* parameters such as temperature and precipitation.

41
42 **Tropical Atlantic modes** See *Tropical Atlantic Variability (TAV)*.

43
44 **Tropical Atlantic Variability (TAV)** A generic term to describe the *climate variability* of the tropical
45 Atlantic which is dominated at interannual to decadal timescale by two main climate modes: the *Atlantic*
46 *Zonal Mode (AZM)* and the *Atlantic Meridional Mode (AMM)*. The Atlantic Zonal Mode, also commonly
47 referred to as the Atlantic Niño or Atlantic equatorial mode, is associated with *sea surface temperature*
48 anomalies near the equator, peaking in the eastern basin, while the Atlantic meridional mode is characterized
49 by an inter-hemispheric gradient of sea surface temperature and wind anomalies. Both modes are associated
50 with significant *teleconnections* over Africa and South America.

51
52 *Atlantic Meridional Mode (AMM)* The Atlantic Meridional Mode (AMM) refers to the interannual to
53 *decadal variability* of the cross-equatorial *sea surface temperature* gradients and surface wind anomalies in
54 the tropical Atlantic. It modulates the strength and latitudinal shifts of the *Inter-tropical Convergence Zone*
55 (*ITCZ*), which impacts regional rainfall over Northeast Brazil and Atlantic hurricane activity. See Section

1 AIV.2.5 in Annex IV of the AR6 WGI report.

2
3 **Atlantic Zonal Mode (AZM)** An equatorial coupled mode in the Atlantic similar to *El Niño-Southern*
4 *Oscillation (ENSO)* in the Pacific, and therefore sometimes referred to as “Atlantic Niño”. The AZM is
5 associated with *sea surface temperature* anomalies near the equatorial Atlantic and rainfall disturbances over
6 the African monsoon domain. Its variations are mostly observed in the interannual scale. It is called also
7 Atlantic equatorial mode. See Section AIV.2.5 in Annex IV of the AR6 WGI report.

8
9 **Tropical cyclone** The general term for a strong, cyclonic-scale disturbance that originates over tropical
10 oceans. Distinguished from weaker systems (often named tropical disturbances or depressions) by exceeding
11 a threshold wind speed. A tropical storm is a tropical cyclone with one-minute average surface winds
12 between 18 and 32 m s⁻¹. Beyond 32 m s⁻¹, a tropical cyclone is called a hurricane, typhoon, or cyclone,
13 depending on geographic location.

14
15 **Tropopause** The boundary between the *troposphere* and the *stratosphere*. It ranges from 8-9 km at high
16 latitudes to 15-16 km in the tropics.

17
18 **Troposphere** The lowest part of the atmosphere, below the *tropopause*, where clouds and weather
19 phenomena occur. In the troposphere, temperatures generally decrease with height. See also *Stratosphere*.

20
21 **Tropospheric ozone** See *Ozone (O₃)* and *Ground-level ozone*.

22
23 **Tundra** A treeless biome characteristic of polar and alpine regions.

24
25 **Turnover time (T)** See *Lifetime*.

26
27 **Typhoon** See *Tropical cyclone*.

28
29 **Typological domains** See *Typological regions*.

30
31 **Typological regions** Regions of the Earth that share one or more specific features (known as 'typologies'),
32 such as geographic location (e.g., coastal), physical processes (e.g., *monsoons*), and biological (e.g., coral
33 reefs, tropical *forests*), geological (e.g., mountains) or *anthropogenic* (e.g., megacities) formation, and for
34 which it is useful to consider the common *climate* features. Typological regions are smaller than climatic
35 zones (e.g., a mountain region) and can be discontinuous (e.g., a group of megacities affected by the *urban*
36 *heat island* effect, or monsoon regions).

37
38 **Uncertainty** A state of incomplete knowledge that can result from a lack of information or from
39 disagreement about what is known or even knowable. It may have many types of sources, from imprecision
40 in the data to ambiguously defined concepts or terminology, incomplete understanding of critical processes,
41 or uncertain projections of *human behaviour*. Uncertainty can therefore be represented by quantitative
42 measures (e.g., a probability density function) or by qualitative statements (e.g., reflecting the judgment of a
43 team of experts) (see Moss and Schneider, 2000; IPCC, 2004; Mastrandrea et al., 2010). See also *Confidence*
44 and *Likelihood*.

45
46 **Deep uncertainty** A situation of deep uncertainty exists when experts or stakeholders do not know or
47 cannot agree on: (1) appropriate conceptual models that describe relationships among key driving forces in a
48 system; (2) the probability distributions used to represent uncertainty about key variables and parameters;
49 and/or (3) how to weigh and value desirable alternative outcomes (Lempert et al., 2003).

50
51 **Sampling uncertainty** Uncertainty arising from incomplete or uneven availability of measurements in either
52 space or time or both.

53
54 **United Nations Framework Convention on Climate Change (UNFCCC)** The UNFCCC was adopted in
55 May 1992 and opened for signature at the 1992 Earth Summit in Rio de Janeiro. It entered into force in

1 March 1994 and as of September 2020 had 197 Parties (196 States and the European Union). The
2 Convention's ultimate objective is the 'stabilisation of greenhouse gas concentrations in the atmosphere at a
3 level that would prevent dangerous anthropogenic interference with the climate system'. The provisions of
4 the Convention are pursued and implemented by two further treaties: the Kyoto Protocol and the Paris
5 Agreement.

6
7 **Uptake** The transfer of substances (such as carbon) or energy (e.g., heat) from one compartment of a
8 system to another; for example, in the Earth System from the atmosphere to the ocean or to the land. See also
9 *Sequestration*.

10
11 **Upwelling region** A region of an ocean where cold, typically nutrient-rich waters well up from the deep
12 ocean.

13
14 **Urban heat island (UHI)** The relative warmth of a city compared with surrounding rural areas, associated
15 with changes in *runoff*, effects on heat retention, and changes in surface albedo.

16
17 **Ventilation** The exchange of ocean properties with the atmospheric *surface layer* such that property
18 concentrations are brought closer to equilibrium values with the *atmosphere* (AMS, 2021), and the processes
19 that propagate these properties into the ocean interior.

20
21 **Vertical land motion (VLM)** Vertical land motion (VLM) is the change in height of the land surface or
22 the sea floor and can have several causes in addition to elastic deformation associated with contemporary
23 changes in *gravity, rotation and viscoelastic solid Earth deformation (GRD)* and viscoelastic deformation
24 associated with *glacial isostatic adjustment (GIA)*. Subsidence (sinking of the land surface or sea floor) can,
25 for instance, occur through compaction of alluvial sediments in deltaic regions, removal of fluids such as
26 gas, oil, and water, or drainage of peatlands. Tectonic deformation of the Earth's crust can occur as a result
27 of earthquakes and volcanic eruptions. See also *Sea level change (sea level rise/sea level fall)*.

28
29 **Very short-lived halogenated substances (VSLs)** Very short-lived halogenated substances (VSLs) are
30 considered to include source gases (very short-lived halogenated substances present in the *atmosphere* in the
31 form they were emitted from natural and *anthropogenic* sources), halogenated product gases arising from
32 source gas degradation, and other sources of *tropospheric* inorganic halogens. VSLs have tropospheric
33 *lifetimes* of around 0.5 years or less.

34
35 **Volatile organic compounds (VOCs)** Important class of organic chemical air pollutants that are volatile at
36 ambient air conditions. Other terms used to represent VOCs are hydrocarbons (HCs), reactive organic gases
37 (ROGs) and non-methane volatile organic compounds (NMVOCs). NMVOCs are major contributors –
38 together with nitrogen oxides (NO_x), and carbon monoxide (CO) – to the formation of photochemical
39 oxidants such as ozone (O₃).

40
41 **Biogenic volatile organic compounds (BVOCs)** Organic gas-phase compounds emitted from terrestrial and
42 aquatic ecosystems that are critical in ecology and plant physiology, from abiotic and biotic stress functions
43 to integrated components of metabolism. BVOCs are important in atmospheric chemistry as precursors for
44 ozone and secondary organic aerosol formation. Other terms used to represent BVOCs are hydrocarbons
45 (HCs), reactive organic gases (ROGs) and non-methane volatile organic compounds (NMVOCs).

46
47 **Vulnerability** The propensity or predisposition to be adversely affected. Vulnerability encompasses a
48 variety of concepts and elements including sensitivity or susceptibility to harm and lack of capacity to cope
49 and adapt. See also *Exposure, Hazard* and *Risk*.

50
51 **Walker circulation** Direct thermally driven zonal overturning circulation in the *atmosphere* over the
52 tropical Pacific Ocean, with rising air in the western and sinking air in the eastern Pacific.

53
54 **Warm days/warm nights** Days where maximum temperature, or nights where minimum temperature,
55 exceeds the 90th percentile, where the respective temperature distributions are generally defined with respect

1 to the 1961-1990 reference period.

2
3 **Warm spell** A period of abnormally warm weather. *Heatwaves* and warm spells have various and, in some
4 cases, overlapping definitions.

5
6 **Water cycle** See *Hydrological cycle*.

7
8 **Water mass** A body of ocean water with identifiable properties (temperature, salinity, density, chemical
9 tracers) resulting from its unique formation process. Water masses are often identified through a vertical or
10 horizontal extremum of a property such as salinity. North Pacific Intermediate Water (NPIW) and Antarctic
11 Intermediate Water (AAIW) are examples of water masses.

12
13 **Water security** ‘The capacity of a population to safeguard sustainable access to adequate quantities of
14 acceptable quality water for sustaining livelihoods, human well-being, and socio-economic development, for
15 ensuring protection against water-borne pollution and water-related disasters, and for preserving ecosystems
16 in a climate of peace and political stability’ (UN-Water, 2013).

17
18 **Wave run-up** See *Extreme sea level (ESL)*.

19
20 **Wave setup** See *Extreme sea level (ESL)*.

21
22 **Weathering** The gradual removal of atmospheric CO_2 through dissolution of silicate and carbonate rocks.
23 Weathering may involve physical processes (mechanical weathering) or chemical activity (chemical
24 weathering).

25
26 **Well-mixed greenhouse gas** A *greenhouse gas* that has an atmospheric *lifetime* long enough (> several
27 years) to be homogeneously mixed in the *troposphere*, and as such the global average mixing ratio can be
28 determined from a network of surface observations. For many well-mixed greenhouse gases, measurements
29 made in remote regions differ from the global mean by < 15%.

30
31 **West African monsoon (W Afrim)** See *Global monsoon*.

32
33 **West Antarctic ice sheet (WAIS)** See *Ice sheet*.

34
35 **Wetland** Land that is covered or saturated by water for all or part of the year (e.g., *peatland*).

36
37 **Younger Dryas** A period 12.85 to 11.65 ka (thousand years before 1950), during the *last deglacial*
38 *transition*, characterized by a temporary return to colder conditions in many locations, especially around the
39 North Atlantic. See also *Stadial* and *Last deglacial transition*.

40
41 **Zero emissions commitment** See *Climate change commitment*.
